siunitx — A comprehensive (SI) units package*

Joseph Wright†

Released 2018-05-02

Abstract

Physical quantities have both numbers and units, and each physical quantity should be expressed as the product of a number and a unit. Typesetting physical quantities requires care to ensure that the combined mathematical meaning of the number–unit combination is clear. In particular, the SI units system lays down a consistent set of units with rules on how these are to be used. However, different countries and publishers have differing conventions on the exact appearance of numbers (and units).

The siunitx package provides a set of tools for authors to typeset quantities in a consistent way. The package has an extended set of configuration options which make it possible to follow varying typographic conventions with the same input syntax. The package includes automated processing of numbers and units, and the ability to control tabular alignment of numbers.

1 Introduction

The correct application of units of measurement is very important in technical applications. For this reason, carefully-crafted definitions of a coherent units system have been laid down by the Conférence Générale des Poids et Mesures (CGPM): this has resulted in the Système International d’Unités (SI). At the same time, typographic conventions for correctly displaying both numbers and units exist to ensure that no loss of meaning occurs in printed matter.

\texttt{siunitx} aims to provide a unified method for \LaTeX{} users to typeset numbers and units correctly and easily. The design philosophy of \texttt{siunitx} is to follow the agreed rules by default, but to allow variation through option settings. In this way, users can use \texttt{siunitx} to follow the requirements of publishers, co-authors, universities, etc. without needing to alter the input at all.

2 Installation

The package is supplied in dtx format and as a pre-extracted zip file, \texttt{siunitx.tds.zip}. The later is most convenient for most users: simply unzip this in your local texmf directory and run \texttt{texhash} to update the database of file locations. If you want to unpack the dtx yourself, running \texttt{tex siunitx.dtx} will extract the package whereas \texttt{latex siunitx.dtx} will extract it and also typeset the documentation.

The package requires \LaTeX{}3 support as provided in the \texttt{l3kernel} and \texttt{l3packages} bundles. Both of these are available on \texttt{CTAN} as ready-to-install zip files. Suitable versions are available in MiKTeX 2.9 and \TeX{} Live 2015 (updating the relevant packages online may be necessary). \LaTeX{}3, and so \texttt{siunitx}, requires the \texttt{e-\TeX} extensions: these are available on all modern \TeX{} systems.

Typesetting the documentation requires a number of packages in addition to those needed to use the package. This is mainly because of the number of demonstration items included in the text. To compile the documentation without error, you will need the packages:

- \texttt{amsmath}
The package provides the user macros:

- \ang{⟨options⟩}{⟨angle⟩}
- \num{⟨options⟩}{⟨number⟩}
- \si{⟨options⟩}{⟨unit⟩}
- \SI{⟨options⟩}{⟨number⟩}{⟨pre-unit⟩}{⟨unit⟩}
- \numlist{⟨options⟩}{⟨numbers⟩}
- \numrange{⟨options⟩}{⟨numbers⟩}{⟨number2⟩}
- \SIlist{⟨options⟩}{⟨numbers⟩}{⟨unit⟩}
- \SIrange{⟨options⟩}{⟨numbers⟩}{⟨number2⟩}{⟨unit⟩}
- \sisetup{⟨options⟩}
- \tablenum{⟨options⟩}{⟨number⟩}

plus the S and s column types for decimal alignments and units in tabular environments. These user macros and column types are designed for typesetting numbers and units with control of appearance and with intelligent processing.

Numbers are processed with understanding of exponents, complex numbers and multiplication.

\begin{verbatim}
12 345.678 90
1 ± 2i
0.3 \times 10^{45}
1.654 \times 2.34 \times 3.430
\end{verbatim}
The unit system can interpret units given as text to be used directly or as macro-based units. In the latter case, different formatting is possible.

\si{kg.m.s^{-1}} \quad \si{kilogram\metre\per\second} \quad \si{\kilo\metre\per\second} \quad \si{\kilo\metre\per\ampere\per\second}

Simple lists and ranges of numbers can be handled.

\numlist{10;20;30} \quad \SIlist{0.13;0.67;0.80}{\milli\metre} \quad \numrange{10}{20} \quad \SIrange{0.13}{0.67}{\milli\metre}

10, 20 and 30
0.13 mm, 0.67 mm and 0.80 mm
10 to 20
0.13 mm to 0.67 mm

By default, all text is typeset in the current upright math font. This can be changed by setting the appropriate options: \sisetup{detect-all} will use the current font for typesetting.

4 Using the siunitx package

4.1 Loading the package

The package should be loaded in the usual \LaTeX way.

\usepackage{siunitx}

The key–value options described later in this document can be used when loading the package, for example

\usepackage[version-1-compatibility]{siunitx}

to use options from version 1 of the package.

4.2 Numbers

\num{\langle\text{options}\rangle}{\langle\text{number}\rangle}

Numbers are automatically formatted by the \num macro. This takes one optional argument, \langle\text{options}\rangle, and one mandatory one, \langle\text{number}\rangle. The contents of \langle\text{number}\rangle are automatically formatted. The formatter removes both ‘soft’ (,) and ‘hard’ spaces (\, and -), automatically identifies exponents (by default marked using e, E, d or D) and adds the appropriate spacing of large numbers. With the standard settings a leading

\num{\langle\text{options}\rangle}{\langle\text{number}\rangle}
zero is added before a decimal marker, if needed: both ‘.’ and ‘,’ are recognised as
decimal markers.

123 \num{123} \numlist{123} \\
1234 \num{1234} \numlist{1234} \\
12345 \num{12345} \numlist{12345} \\
0.123 \num{0.123} \numlist{0.123} \\
0.1234 \num{0.1234} \numlist{0.1234} \\
0.12345 \num{0.12345} \numlist{0.12345} \\
3.45 \times 10^{-4} \num{3.45d-4} \numlist{3.45d-4} \\
-10^{10} \num{-e10} \numlist{-e10} \n
Note that numbers are parsed before typesetting, which does have a performance over-
head (only obvious with very large amounts of numerical input). The parser under-
stands a range of input syntaxes, as demonstrated above.

\numlist

\numlist[(options)]{(numbers)}

Lists of numbers may be processed using the \numlist function. Each \textit{(number)} is
given within the list of \textit{(numbers)} within a brace pair, as the list can have a flexible
length. This function should be used in text mode, a common feature of all of the list
and range functions provided by \texttt{siunitx}.

10, 30, 50 and 70 \numlist{10;30;50;70} \numlist{10,30,50,70}

\numrange

\numrange[(options)]{(number1)}{(number2)}

Simple ranges of numbers can be handled using the \numrange function. This acts in
the same way as \texttt{num}, but inserts a phrase or other text between the two entries. This
function should be used in text mode.

10 to 30 \numrange{10}{30} \numrange{10;30}

\ang

\ang[(options)]{(angle)}

Angles can be typeset using the \ang command. The \textit{(angle)} can be given either as
a decimal number or as a semi-colon separated list of degrees, minutes and seconds,
which is called ‘arc format’ in this document. The numbers which make up an angle
are processed using the same system as other numbers.

10° \ang{10} \ang{10;}
12.3° \ang{12.3} \ang{12;3}
4.5° \ang{4,5} \ang{0,4,5,6}
1°2′3″ \ang{1;2;3} \ang{1;20;30;30}
1″ \ang{;;1} \ang{;;1;}
10° \ang{+10;} \ang{+10;10}
−0°1′ \ang{-0;1;} \ang{-0;1;}

6
4.3 Units

\si\[\langle\text{options}\rangle\]{\langle\text{unit}\rangle}

The symbol for a unit can be typeset using the \si macro: this provides full control over output format for the unit. Like the \num macro, \si takes one optional and one mandatory argument. The unit formatting system can accept two types of input. When the \langle\text{si}\rangle contains literal items (for example letters or numbers) then \siunitx converts . and - into inter-unit product and correctly positions sub- and superscripts specified using _ and ^. The formatting methods will work with both math and text mode.

\sis{kg.m/s^2} \quad \sis{g_{\text{polymer}}\cdot mol_{\text{cat}}.s^{-1}}

The second operation mode for the \si macro is an ‘interpreted’ system. Here, each unit, SI multiple prefix and power is given a macro name. These are entered in a method very similar to the reading of the unit name in English.

\sis{\text{kilo}\gram\metre\per\square\second} \quad \sis{\gram\per\cubic\centi\metre} \\
\sis{\square\text{volt}\cubic\text{lumen}\per\text{farad}} \quad \sis{\text{metre}\text{\textsuperscript{2}}\per\text{gray}\text{\textsuperscript{3}}\text{lux}} \\
\sis{\text{henry}\per\text{second}}

kg.m/s^2 \quad g.cm^{-3} \\
V^2.lm^3.F^{-1} \quad m^2.Gy^{-1}.lx^3 \\
Hs

On its own, this is less convenient than the direct method, although it does use meaning rather than appearance for input. However, the package allows you to define new unit macros; a large number of pre-defined abbreviations are also supplied. More importantly, by defining macros for units, instead of literal input, new functionality is made available. By altering the settings used by the package, the same input can yield a variety of different output formats. For example, the \per macro can give reciprocal powers, slashes or be used to construct units as fractions.

\SI\[\langle\text{options}\rangle\]{\langle\text{number}\rangle}\{\langle\text{preunit}\rangle\}{\langle\text{unit}\rangle}

Very often, numbers and units are given together. Formally, the value of a quantity is the product of the number and the unit, the space being regarded as a multiplication sign \[.\] The \SI macro combines the functionality of \num and \si, and makes this both possible and easy. The \langle\text{number}\rangle and \langle\text{si}\rangle arguments work exactly like those for the \num and \si macros, respectively. \langle\text{preunit}\rangle is a unit to be typeset before the numerical value (most likely to be a currency).

\footnote{The reason for this restriction is that the separators between items may involve text-mode spaces which must be able to vanish at line breaks. It is not possible to achieve this effect from inside math mode.}
\SI{1.23}{\text{J.mol}^{-1}.K^{-1}} \quad \SI{.23e7}{\text{candela}} \quad \SI{1.99}{\text{\$/kg}} \quad \SI{1.345}{\text{Coulomb/\text{mole}}}

It is possible to set up the unit macros to be available outside of the \SI and \si functions. This is not the standard behaviour as there is the risk of name clashes (for example, \text{\textbackslash bar} is used by other packages, and several packages define \text{\textbackslash degree}). Full details of using ‘stand alone’ units are found in Section 5.10.

\textbf{\SIlist}

\SIlist\{\langle options\rangle\}{\langle numbers\rangle}{\langle unit\rangle}

Lists of numbers with units can be handled using the \SIlist function. The behaviour of this function is similar to \numlist, but with the addition of a unit to each number. This function should be used in text mode.

10 m, 30 m and 45 m \SIlist{10;30;45}{\text{m}}

\textbf{\SIrange}

\SIrange\{\langle options\rangle\}{\langle number1\rangle}{\langle number2\rangle}{\langle unit\rangle}

Ranges of numbers with units can be handled using the \SIrange function. The behaviour of this function is similar to \numrange, but with the addition of a unit to each number. This function should be used in text mode.

10 m to 30 m \SIrange{10}{30}{\text{m}}

\section{The unit macros}

The package always defines the basic set of SI units with macro names. This includes the base SI units, the derived units with special names and the prefixes. A small number of powers are also given pre-defined names. Full details of units in the SI are available on-line \cite{1}.

The seven base SI units are always defined (Table \ref{tab:si-units}). In addition, the macro \texttt{\textbackslash meter} is available as an alias for \texttt{\textbackslash metre}, for users of US spellings. The full details of the base units are given in the SI Brochure \cite{3}.

The SI also lists a number of units which have special names and symbols \cite{4}: these are listed in Table \ref{tab:si-special}. As a short-cut for the degree Celsius, the unit \texttt{\textbackslash celsius} is defined equivalent to \texttt{\textbackslash degreeCelsius}.

In addition to the official SI units, \texttt{siunitx} also provides macros for a number of units which are accepted for use in the SI although they are not SI units. Table \ref{tab:si-accepted} lists the ‘accepted’ units \cite{6}. Some units are fundamental physical quantities, and these are non-SI but can be used within the SI (Table \ref{tab:si-non-si}, \cite{7}). There are also a set of non-SI units which are used in certain defined circumstances (Table \ref{tab:si-define}), although they are not necessarily officially sanctioned \cite{8}. The package also predefines the \texttt{\textbackslash percent} macro. While this is not a unit, it is used in the same way in many cases and is therefore provided on the grounds of realism.

</table>

In addition to the units themselves, \siunitx provides pre-defined macros for all of the SI prefixes (Table 6, [5]). The spelling ‘\deka’ is provided for US users as an alternative to \deca.

A small number of pre-defined powers are provided as macros. \square and \squared are intended for use before units, with \cubic and \cubed going after the unit.

\begin{verbatim}
Bq^2 \\si{\becquerel^2} \\
J^2 \\si{\joule^2\per\lumen} \\
x^3V^{-1} \\si{\cubic\lux\volt^{-1}}
\end{verbatim}

Generic powers can be inserted on a one-off basis using the \tothe and \raiseto macros. These are the only macros for units which take an argument:

\begin{verbatim}
H^{5} \\si{\henry^{5}} \\
\radian^{4.5} \\si{\raiseto{4.5}\radian}
\end{verbatim}

Reciprocal powers are indicated using the \per macro. This applies to the next unit only, unless the sticky-per option is turned on.

\begin{verbatim}
Jmol^{-1}K^{-1} \\si{\joule\per\mole\per\kelvin} \\
Jmol^{-1}K \\si{\joule\per\mole\kelvin} \\
H^{-5} \\si{\per\henry^{5}} \\
Bq^{-2} \\si{\per\becquerel^{-2}}
\end{verbatim}

As for generic powers, generic qualifiers are also available using the \of function:

\begin{verbatim}
\si{\kilogram\of\metal} \\
\SI[qualifier-mode = brackets]{0.1}{\milli\mole\of\cat\per\kilogram\of\prod}
\end{verbatim}

If the cancel package is loaded, it is possible to ‘cancel out’ units using the \cancel macro. This applies to the next unit, in a similar manner to a prefix. The \highlight macro is also available to selectively colour units. Both \cancel and \highlight are of course outside of the normal semantic meaning of units, but are provided as they may be useful in some cases.
When using the unit macros, the package is able to validate the input given. As part of this, stand-alone unit prefixes can be used with the \si macro

\si{\kilo} \\ \si{\micro} \\ \si[prefixes-as-symbols = false]{\kilo}

k
µ
10³

However, the package only allows a single prefix to be used in this way: multiple prefixes will give an error, as will trying to give a number without a unit. So the following will raise errors:

\si{\kilo\gram\micro} \\ \SI{10}{\micro}

Creating new macros

The various macro components of a unit have to be defined before they can be used. The package supplies a number of common definitions, but new definitions are also possible. As the definition of a logical unit should remain the same in a single document, these creation functions are all preamble-only.

\DeclareSIUnit

\DeclareSIUnit[⟨options⟩]{⟨unit⟩}{⟨symbol⟩}

New units are produced using the \DeclareSIUnit macro. \langle symbol \rangle can contain literal input, other units, multiple prefixes, powers and \per, although literal text should not be intermixed with unit macros. Units can be created with \langle options \rangle from the usual list understood by siunitx, and apply the specific unit macro only. The (first) optional argument to \SI and \si can be used to override the settings for the unit. A typical example is the \degree unit.

3.1415° \SI{3.1415}{\degree}

This is declared in the package as:

\DeclareSIUnit[number-unit-product = {}]{\degree}{\SIUnitSymbolDegree}

The spacing can still be altered at point of use:

\SI[67890]{\degree} \\ \SI[number-unit-product = \,\,]{67890}{\degree}

67 890°
The meaning of a pre-defined unit can be altered by using \DeclareSIUnit after loading siunitx. This will overwrite the original definition with the newer version.

\DeclareSIPrefix \DeclareBinaryPrefix
\DeclareSIPrefix{⟨prefix⟩}{⟨symbol⟩}{⟨powers-ten⟩}
\DeclareBinaryPrefix{⟨prefix⟩}{⟨symbol⟩}{⟨powers-two⟩}

The standard SI powers of ten are defined by the package, and are described above. However, the user can define new prefixes with \DeclareSIPrefix. The \DeclareBinaryPrefix function is also available for creating binary prefixes, with the same syntax (⟨powers-ten⟩ being replaced by ⟨powers-two⟩). For example, \kilo and \kibi are defined:

\DeclareSIPrefix\kilo{k}{3}
\DeclareBinaryPrefix\kibi{Ki}{10}

\DeclareSIQualifier \DeclareSIQualifier
\DeclareSIQualifier{⟨qualifier⟩}{⟨symbol⟩}
These create power macros to appear before or after the unit they apply to. For example, the preamble to a document might contain:

\DeclareSIQualifier\quartic{4}
\DeclareSIQualifier\tothefourth{4}

with the functions then used in the document as:

kg\textsuperscript{4} \quad \text{kg}^4
m\textsuperscript{4} \quad \text{m}^4
\SI{1.234}{\kilogram\tothefourth\per\mole\per\hour}
1.234 g\textsubscript{pol} mol\textsuperscript{−1} h\textsuperscript{−1}

### 4.6 Tabular material

Aligning numbers in tabular content is handled by a new column type, the S column. This new column type can align material using a number of different strategies, with the aim of flexibility of output without needing to alter the input. The method used as standard is to place the decimal marker in the number at the centre of the cell and to align the material appropriately (Table 7).
Table 7 – Standard behaviour of the S column type.

<table>
<thead>
<tr>
<th>Some Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.3456</td>
</tr>
<tr>
<td>34.2345</td>
</tr>
<tr>
<td>−6.7835</td>
</tr>
<tr>
<td>90.473</td>
</tr>
<tr>
<td>5642.5</td>
</tr>
<tr>
<td>1.2 × 10^3</td>
</tr>
<tr>
<td>10^4</td>
</tr>
</tbody>
</table>

The S column will attempt to automatically detect material which should be placed before or after a number, and will maintain the alignment of the numerical data (Table 8). If the material could be mistaken for part of a number, it should be protected by braces. The use of \texttt{\textcolor{red}{\textbullet}} in a table cell will also be detected and will override any general colour applied by \texttt{\textcolor{red}{\textbullet}}.
Table 8 – Detection of surrounding material in an S column.

<table>
<thead>
<tr>
<th>Some Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.34</td>
</tr>
<tr>
<td>975.31</td>
</tr>
<tr>
<td>44.268</td>
</tr>
</tbody>
</table>

\texttt{\textbackslash tablenum[\{options\}](\{number\})}

Within more complex tables, aligned numbers may be desirable within the argument of \texttt{\textbackslash multicolumn} or \texttt{\textbackslash multirow}. The \texttt{\textbackslash tablenum} function is available to achieve alignment in these situations: this is, in effect, a macro version of the S macro (Table 9).

\begin{table}
\caption{Controlling complex alignment with the \texttt{\cs{tablenum}} macro.}
\label{tab:tablenum}
\centering
\begin{tabular}{lr}

& bbb \\
\multirow{2}*{\texttt{\tablenum\{33,435\}}} & ccc \\
& ddd \\
\bottomrule
\end{tabular}
\end{table}

As a complement to the S column type, \texttt{siunitx} also provides a second column type, s. This is intended for producing columns of units. This allows both macro-based and explicit units to be printed easily (Table 10).

\begin{table}
\begin{tabular}{lr}
\toprule
Heading & Heading \\
\midrule
\multicolumn{2}{c}{\texttt{\tablenum\{table-format = 4.4\}]\{12,34\}}} \\
\multicolumn{2}{c}{\texttt{\tablenum\{table-format = 4.4\}]\{333.5567\}}} \\
\multicolumn{2}{c}{\texttt{\tablenum\{table-format = 4.4\}]\{4563.21\}}} \\
\bottomrule
\end{tabular}

\toprule
\multicolumn{1}{c}{Unit} \\
\midrule
\metre\squared\per\second \\
pascal \\
m.s^{-1} \\
\bottomrule
\end{tabular}
\end{table}

As the `\si` macro can take literal or macro input, the `s` column cannot validate the input. `Everything` in an `s` column is therefore passed to the `\si` macro for processing. To prevent this, you have to use `\multicolumn`, as is shown in Table 11. Notice that braces alone do not prevent processing and colouring of the cell contents.

\begin{table}

5 Comprehensive details of package control options

5.1 The key–value control system

The behaviour of the \siunitx package is controlled by a number of key–value options. These can be given globally using the \sisetup function or locally as the optional argument to the user macros.

The package uses a range of different key types:

- **Choice** Takes a limited number of choices, which are described separately for each key.
- **Integer** Requires a number as the argument.
- **Length** Requires a length, either as a literal value such as 2.0 cm, or stored as a \LaTeX length, or \TeX dimension.
- **Literal** A key which uses the value(s) given directly, either to check input (for example the input-digits key) or in output.
- **Macro** Requires a macro, which may need a single argument.
- **Math** Similar to a literal option, but the input is always used in math mode, irrespective of other \siunitx settings. Thus to text-mode only input must be placed inside the argument of a \text macro.
- **Meta** These are options which actually apply a number of other options. As such, they do not take any value at all.
- **Switch** These are on–off switches, and recognise true and false. Giving just the key name also turns the key on.

The tables of option names use these descriptions to indicate how the keys should be used.

5.2 Detecting fonts

The \siunitx package controls the font used to print output independently of the surrounding material. The standard method is to ignore the surroundings entirely, and to use the current body fonts. However, the package can detect and follow surrounding bold, italic and font family changes. The font detection options are summarised in Table 12.

The options detect-weight and detect-shape set detection of the prevailing font weight and font shape states, respectively. The font shape state is only checked
Table 12 – Font detection options.

</tr>
</tbody>
</table>

if the surrounding material is not in math mode (as math text is always italic). The detect-shape option is an extension of the older detect-italic option, which is retained for backward compatibility. Detecting the current family (roman, sans serif or monospaced) is controlled by the detect-family setting, while the current mode (text or math) is detected using the detect-mode switch. For convenience, all of the preceding options can be turned on or off in one go using the detect-all and detect-none options. As the names indicate, detect-all sets all of detect-weight, detect-family, detect-shape and detect-mode to true, while detect-none sets all of them to false.

When \textit{siunitx} macros are used in in-line math, the detection of font weight and font family can be tuned using the detect-inline-family and detect-inline-weight options. Both of these take the choices text and math.

\sisetup{
  detect-family = true,
  detect-inline-family = math
%

\sisetup{detect-inline-weight = text}
5678
\boldmath \num{5678}\ %
5678
\bfseries \num{5678}\ %
5678
}

The font detection system can treat displayed mathematical content in two ways. This is controlled by the detect-display-math option. When set true, display mathematics is treated independently from the body of the document. Thus the local \textit{math} font is checked for matching. In contrast, when set false, display material is treated

More text
\[ y = 3 \text{ m s mol} \]

5.3 Font settings

The relationship between font family detected and font family used for output is not fixed. The font detected by the package in the surrounding material does not have to match that used for output (Table 13).

The `mode` option determines whether \siunitx uses math or text mode when printing output. The choices are `math` and `text`. When using math mode, text is printed using a math font whereas in text mode a text font is used. The extent to which this is visually obvious depends on the fonts in use in the document. This manual uses old style (lower-case) figures in text mode to highlight the differences. This option has no effect if the `detect-mode` switch is true.

If font family detection is inactive, \siunitx uses the font family stored in either `math-rm`, `math-sf` or `text-rm` for output. The choice of `math` or `text` depends on the `mode` setting. If font family detection is active, \siunitx may be using a sans serif or monospaced font for output. In math mode, these are stored in `math-sf` and `math-tt`, and for text mode in `text-sf` and `text-tt`. Notice that the detected and output font families can differ.

³Here, ‘display’ math means either typeset in \TeX’s display math mode or using the AMS display-like environments. Simply using \displaystyle will not make otherwise in line math be detected as display math.
The colour of printed output can be set using the \texttt{color} option. When no colour is given, printing follows the surrounding text. In contrast, when a specific colour is given, it is used irrespective of the surroundings. As there are a number of different colour models available, it is left to user to load \texttt{color} or a more powerful colour package such as \texttt{xcolor}.

\begin{verbatim}
\textcolor{red}{Some text} \SI{4}{\metre\per\sievert} \textcolor{blue}{More text} \SI{4}{\metre\per\sievert} \textcolor{red}{Still red here!}
\end{verbatim}

Every one of the font options can be given independently for units and number, with the prefixes \texttt{unit-} and \texttt{number-}, respectively. This allows fine control of output.

\begin{verbatim}
\SI{4}{\angstrom} \SI[number-color = green]{4}{\angstrom} \SI[unit-color = green]{4}{\angstrom}
\end{verbatim}

### 5.4 Parsing numbers

The package uses a sophisticated parsing system to understand numbers. This allows \texttt{siunitx} to carry out a range of formatting, as described later. All of the input options take lists of literal tokens, and are summarised in Table 14.

The basic parts of a number are the digits, any sign and a separator between the integer and decimal parts. These are stored in the input options \texttt{input-digits}, \texttt{input-decimal-markers} and \texttt{input-signs}, respectively. More than one input decimal marker can be used: it will be converted by the package to the appropriate output marker. Numbers which include an exponent part also require a marker for the exponent: this again is taken from the range of tokens in the \texttt{input-exponent-markers} option.

As well as ‘normal’ digits, the package will interpret symbolic ‘numbers’ (such as \texttt{\pi}) correctly if they are included in the \texttt{input-symbols} list. Symbols are always printed in math mode. Tokens given in the \texttt{input-ignore} list are totally passed over by \texttt{siunitx}: they will be removed from the input with no further processing.

In addition to signs, \texttt{siunitx} can recognise comparators, such as \texttt{<}. The package will automatically carry out conversions for \texttt{<, >, <= and >=} to \texttt{\ll, \gg, \leq and \geq}, respectively:

</tbody>
</table>

| `<10`                               | `\num{<10} \)` |
| `≥5 m`                              | `\SI{≥5}{\metre} \)` |
| `≤0.12`                            | `\num{≤0.12} \)` |

#### In some fields, it is common to give the uncertainty in a number in brackets after the main part of the number, for example `1.234(5)`. The opening and closing symbols used for this type of input are set as `input-open-uncertainty` and `input-close-uncertainty`. Alternatively, the uncertainty may be given as a separate part following a sign. Which signs are valid for this operation is determined by the `input-uncertainty-signs` option. As with other signs, the combination `+-` will automatically be converted to `\pm` internally.

\[
\begin{align*}
9.99(9) & \quad \text{\num{9.99(9)} \)} \\
9.99(9) & \quad \text{\num{9.99 \pm 0.09} \)} \\
9.99(9) & \quad \text{\num{9.99 \pm 0.09} \)} \\
123.0(45) & \quad \text{\num{123 \pm 4.5} \)} \\
12.3(60) & \quad \text{\num{12.3 \pm 6} \)} \\
\end{align*}
\]

#### When using complex numbers in input, the complex root \((i = \sqrt{-1})\) is indicated by one of the tokens stored in `input-complex-roots`. The parser understands complex root symbols given either before or after the associated number (but will detect any invalid arrangement):

\[
\begin{align*}
9.99 + 88.8i & \quad \text{\num{9.99 + 88.8i} \)} \\
9.99 + 88.8i & \quad \text{\num{9.99 + 88.8i} \)} \\
\end{align*}
\]

#### Some symbols can be problematic under expansion in \LaTeX. To allow these to be used in input without issue, the package can protect these tokens while expanding input. Symbols to be protected in this way should be listed in `input-protect-tokens`.

The `parse-numbers` option turns the entire parsing system on and off. The option is made available for two reasons. First, if all of the numbers in a document are to

be reproduced ‘as given’, turning off the parser will represent a significant saving in processing required. Second, it allows the use of arbitrary \LaTeX\ code in numbers. If the parser is turned off, the input will be printed in math mode (requiring \text to protect any text in the number).

\num[parse-numbers = false]{\sqrt{2}} \\ \SI[parse-numbers = false]{\sqrt{3}}{\metre}

\sqrt{2} \sqrt{3}\text{m}

### 5.5 Post-processing numbers

Before typesetting numbers, various post-processing steps can be carried out. These involve adding or removing information from the number in a systematic way; the options are summarised in Table 15.

The \texttt{siunitx} package can round numerical input to a fixed number of significant figures or decimal places. This is controlled by the round-mode option, which takes the choices off, figures and places. When rounding is turned on, the number of digits used (either decimal places or significant figures in the mantissa) is set using the round-precision option. No rounding will take place if the number contains an uncertainty component.
The standard settings for \texttt{siunitx} do not add a decimal part if none was given in the input. The \texttt{round-integer-to-decimal} option can be used to allow this conversion as part of the rounding process.

It may be desirable to convert decimals to integers if the decimal part is zero. This is set up using the \texttt{zero-decimal-to-integer} option.

There are cases in which rounding will result in the number reaching zero. It may be desirable to show such results as below a threshold value. This can be achieved by setting \texttt{round-minimum} to the threshold value. There will be no effect when rounding to a number of significant figures as it is not possible to obtain the value zero in these cases.

In cases where the rounded part of a number is exactly half, there are two common methods for 'breaking the tie'. The choice of method is determined by the option \texttt{round-half}, which recognises the choices up and even.
It is possible to give real (floating point) numbers as input omitting the decimal or the integer parts of the number (for example 0.123 or 123.0). The options `add-decimal-zero` and `add-integer-zero` allow the package to ‘fill in’ the missing zero.

```
\sisetup{add-decimal-zero = false, add-integer-zero = false}
```

Related is the `minimum-integer-digits` option. This applies only to the integer part of the mantissa, and ensures that it will contain at least the specified number of digits. This is achieved by padding with zeros if needed.

```
\num{123} \\n\num[minimum-integer-digits = 1]{123} \\n\num[minimum-integer-digits = 2]{123} \\n\num[minimum-integer-digits = 3]{123} \\n\num[minimum-integer-digits = 4]{123}
```

The inclusion of a leading plus sign is usually unnecessary for positive numbers, and so the `retain-explicit-plus` option is available to control whether these are printed. At the same time, it may be useful to force all numbers to have a sign. This behaviour is controlled by the `explicit-sign` option: this is used if given and if no sign was present in the input.

```
\num{345} \\n\num[retain-explicit-plus]{345} \\n\num[explicit-sign = -]{345} \\n\num[explicit-sign = -]{+345}
```

The retention of a zero exponent is controlled by the `retain-zero-exponent` option. The retention of a mantissa of one is likewise controlled by the `retain-unity-mantissa` option.
Numbers can be converted to scientific notation by the package. This is controlled by the `scientific-notation` option, which takes choices false, true, fixed and engineering. The fixed setting will use the exponent value by the `fixed-exponent` option. When engineering is set, the exponent is always a power of three.

When used with a `fixed-exponent` of zero, this may be used to remove scientific notation from the input

When used with a fixed-exponent of zero, this may be used to remove scientific notation from the input

Note that these options apply after any removal of unit mantissa, zero exponent, etc.

The printing of an uncertainty can be suppressed entirely using the `omit-uncertainty` option.

5.6 Printing numbers

Actually printing numbers is controlled by a number of settings, which apply ideas such as differing decimal markers, digit grouping and so on. All of these options are concerned with the appearance of output, rather than the data it conveys. The options are summarised in Table 16.

Grouping digits into blocks of three is a common method to increase the ease of reading of numbers. The group-digits choice controls whether this behaviour applies, and takes the values true, false, decimal and integer. Grouping can be activated separately for the integer and decimal parts of a number using the appropriately-named values.

\num{12345.67890} \num[group-digits = false]{12345.67890} \num[group-digits = decimal]{12345.67890} \num[group-digits = integer]{12345.67890}
12345.67890
12345.67890
12345.67890
12 345.67890

26
The separator used between groups of digits is stored by the `group-separator` option. This takes literal input and may be used in math mode: for a text-mode full space use `\text{-}`.

```latex
\num{12345} \\
\num[group-separator = {,}]{12345} \\
\num[group-separator = \text{-}]{12345}
```

12 345

12,345

12 345

Grouping is not always applied to smaller numbers, and the option `group-minimum-digits` is available to specify how many digits must be present before grouping is applied. The number of digits is considered separately for the integer and decimal parts of the number: grouping does not ‘cross the boundary’.

```latex
\num{1234} \\
\num[group-minimum-digits = 4]{1234} \\
\num{1234.5678} \\
\num[group-minimum-digits = 4]{1234.5678}
```

1234

1 234

1234

1 234.567 8

1 234.567 8

The decimal marker used in output is set using the `output-decimal-marker` option. This can differ from the input marker, as can the root of \(\sqrt{-1}\), which is stored in the `output-complex-root` option. The standard setting uses `\mathrm` in math mode to give an upright ‘i’: this can easily be altered. The complex root or decimal marker from the input can be used in the output by setting the `copy-complex-root` and `copy-decimal-marker` options, respectively.

```latex
\num{1.23} \\
\num[output-decimal-marker = {,}]{1.23} \\
\num{1+2i} \\
\num[output-complex-root = \text{\ensuremath{i}}]{1+2i} \\
\num[output-complex-root = j]{1+2i} \\
\num[copy-complex-root]{1+2j} \\
\num[copy-decimal-marker]{555,555}
```

1.23

1,23

1 + 2i

1 + 2i

1 + 2j

1 + 2j

555,555

The position of the complex root can be adjusted to place it either before or after the associated numeral in a complex number using the `complex-root-position` option.

```latex
\num{67-0.9i} \\
\num[complex-root-position = before-number]{67-0.9i} \\
\num[complex-root-position = after-number]{67-0.9i}
```

67 – 0.9i

67 – 0i.9

67 – 0.9i

27
When exponents are present in the input, the exponent-base and exponent-product options set the obvious parts of the output. Notice that the base is in the current mode, but the product sign is always in math mode.

\num[exponent-product = \times]{1e2}
\num[exponent-product = \cdot]{1e2}
\num[exponent-base = 2]{1e2}

Alternatively, if the output-exponent-marker option is set then the value stored will be used in place of the normal product and base combination. This will normally be set up to ensure math or text mode.

\num[output-exponent-marker = \text{e}]{1e2}
\num[output-exponent-marker = \ensuremath{\mathrm{E}}]{1e2}

When input is given including an uncertainty in a number, it can be printed either with the uncertainty in brackets or as a separate number. This behaviour is controlled by the separate-uncertainty choice. If the uncertainty is given in brackets, a space may be added between the main number and the uncertainty: this is stored using the uncertainty-separator option. The opening and closing brackets used are stored in output-open-uncertainty and output-close-uncertainty, respectively.

\num{1.234(5)}
\num[separate-uncertainty = true]{1.234(5)}
\sisetup{
  output-open-uncertainty = [,,
  output-close-uncertainty = ],
  uncertainty-separator = {,}
}
\num{1.234(5)}
1.234(5)
1.234 ± 0.005
1.234 [5]

Notice that siunitx correctly interprets uncertainties which cross the decimal marker position whether these are separated out or not.

8.2(13)
8.2 ± 1.3
\num{8.2(13)}
\num[separate-uncertainty]{8.2(13)}

There are certain combinations of numerical input which can be ambiguous. This can be corrected by adding brackets in the appropriate place, and is controlled by the bracket-numbers switch. The opening and closing brackets used are stored in open-bracket and close-bracket, respectively. Note that bracket-numbers only applies to numbers without units: for numbers with units see the multi-part-units option.
\num{1+2i \times 10^{10}}
\num[bracket-numbers = false]{1+2i \times 10^{10}}
\sisetup{
  open-bracket = \{, 
  close-bracket = \}, 
}\num{1+2i \times 10^{10}}
\num{1+2i \times 10^{10}}

**negative-color** \siunitx can detect negative mantissa values and alter print colour accordingly. This is disabled by setting the option to an empty value.

\num{-15673} \num{-15673}
\num[negative-color = red]{-15673}

**bracket-negative-numbers** A common means to display negative numbers in financial situations is to place them in brackets. This can be carried out automatically using the `bracket-negative-numbers` option.

\num{-15673} \num{-15673} \SI{-10}{\text{metre}} \SI{-10}{\text{metre}}
\num{-15673} \num{-15673} \SI{-10}{\text{metre}} \SI{-10}{\text{metre}}

**tight-spacing** Under some circumstances it may be desirable to ‘squeeze’ the output spacing. This is turned on using the `tight-spacing` switch, which compresses spacing where possible.

\num{1 \pm 2i \times 10^{3}} \num{1 \pm 2i \times 10^{3}}
\num[tight-spacing = true]{1 \pm 2i \times 10^{3}} \num[tight-spacing = true]{1 \pm 2i \times 10^{3}}

### 5.7 Multi-part numbers
\siunitx recognises the idea of products and quotients in numbers, both with and without units. These multi-part numbers have a number of options affecting how they are processed. The options are summarised in Table 17.

**input-product** and **input-quotient** contain the tokens used to determine if a number contains multiple parts.

1 \times 2 \times 3 \num{1 \times 2 \times 3}
1 \times 10^{4} \times 2(3) \times 3/4 \num{1e4 \times 2(3) \times 3/4}
4 \times 5 \times 6 \num{[input-product=*]{4 \times 5 \times 6}}
1/(2 \times 10^{4}) \num{1 / 2e4}
1 \times 10^{2} / (3 \times 10^{4}) \num{1e2 / 3e4}
The symbols used for printing products and quotients are stored using the options `output-product` and `output-quotient`.

\begin{verbatim}
\num[output-product = \cdot]{4.87 \times 5.321 \times 6.90545} \text{ } \\num[output-quotient = \text{ div }]{1 / 2}
4.87 \cdot 5.321 \cdot 6.90545
1 \text{ div } 2
\end{verbatim}

For quotients, there is the possibility to print output either using a slash, or using the \texttt{\frac} macro. This is controlled by the `quotient-mode` choice option, which takes values `symbol` and `fraction`.

\begin{verbatim}
\num{1 / 2e4} \text{ } \\num[quotient-mode = fraction]{1 / 2e4}
1 / (2 \times 10^4)
\end{verbatim}

The function used when `quotient-mode = fraction` is set is determined by the `fraction-function` option. This should be set to a function which takes two arguments, and presumably creates some type of fraction. Most alternatives to the standard \texttt{\frac} function will involve loading additional packages: the demonstrations here need \texttt{amsmath} and \texttt{xfrac}.

\begin{verbatim}
\sisetup{quotient-mode = fraction}
\num{1 / 1}
\num[fraction-function = \dfrac]{1 / 2}
\num[fraction-function = \sfrac]{1 / 3}
\num[fraction-function = \tfrac]{1 / 4}
\end{verbatim}

### 5.8 Lists and ranges of numbers

Lists and ranges of numbers have a small number of specialised options, which apply to these more unusual input forms (Table 18).

Lists of numbers are printed with a separator between each item, which is stored using the `list-separator` option. The separator before the last item of a list may be different, and is therefore set using the `list-final-separator` option. The separator used for exactly two items is set using the `list-pair-separator` option. Any spaces needed should be included in the option settings: none are added within the code. These items are printed in text mode.
Table 18 – Output options for lists and ranges of numbers.

<table>
<thead>
<tr>
<th>Option name</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>list-final-separator</td>
<td>Literal</td>
<td>\texttt{\textbackslash and\textbackslash }</td>
</tr>
<tr>
<td>list-pair-separator</td>
<td>Literal</td>
<td>\texttt{\textbackslash and\textbackslash }</td>
</tr>
<tr>
<td>list-separator</td>
<td>Literal</td>
<td>\texttt{,\textbackslash }</td>
</tr>
<tr>
<td>range-phrase</td>
<td>Literal</td>
<td>\texttt{\textbackslash to\textbackslash }</td>
</tr>
</tbody>
</table>

\begin{verbatim}
\numlist{0.1;0.2;0.3} \\ \\
\numlist[list-final-separator = {, }]{0.1;0.2;0.3} \\ \\
\numlist[list-pair-separator = {, and }]{0.1;0.2} \\ \\
\numlist[list-separator = { and }, list-final-separator = { and finally }]{0.1;0.2;0.3} \\ \\
\numlist{0.1;0.2;0.3} \\ \\
\numlist{0.1;0.2} \\ \\
\numlist[list-pair-separator = {, }]{0.1;0.2} \\ \\
\numlist[list-final-separator = { and finally }]{0.1;0.2;0.3} \\ \\
\end{verbatim}

Ranges of numbers can be given as input. These will have an appropriate word or symbol inserted between the two entries: this is stored using the \texttt{range-phrase} option. The phrase should include any necessary spaces: no extra space is added.

5 to 100 \numrange{5}{100} \\ \\
5–100 \numrange[range-phrase = --]{5}{100}

For lists and ranges when a single unit is given, \texttt{siunitx} will automatically ‘compress’ exponents when a fixed exponent is in use.

\begin{verbatim}
\sisetup{
  fixed-exponent = 3 ,
  list-units = brackets ,
  range-units = brackets ,
  scientific-notation = fixed
}
\SIrange{1e3}{7e3}{\metre} \\ \\
\SIlist{1e3;2e3;3e3}{\kg}
\end{verbatim}

5.9 Angles

Angle processing provided by the \texttt{ang} function has a set of options which apply in addition to the general ones set up for number processing (Table 19).

The separator between the number and angle symbol (degrees, minutes or seconds) can be set using the \texttt{number-angle-product} option, independent of the related \texttt{number-unit-product} option used by the \texttt{SI} function.
Table 19 – Angle options.

<table>
<thead>
<tr>
<th>Option name</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>add-arc-degree-zero</td>
<td>Switch</td>
<td>false</td>
</tr>
<tr>
<td>add-arc-minute-zero</td>

<tr>
<td>number-angle-product</td>
<td>Literal</td>
<td>⟨empty⟩</td>
</tr>
</tbody>
</table>

2.67° \[\text{\textbackslash{ang}}(2.67) \text{\textbackslash{\parallel}}\]
2.67° \[\text{\textbackslash{ang}}(\text{\textbackslash{number-angle-product}}} = \text{\textbackslash{,}}\{2.67}\]

**arc-separator**

When angles are printed in arc format, the separation of the different parts is set up using the arc-separator option.

6°7′6.5″ \[\text{\textbackslash{ang}}(6;7;6.5) \text{\textbackslash{\parallel}}\]
6° 7′ 6.5″ \[\text{\textbackslash{ang}}(\text{\textbackslash{arc-separator}}} = \text{\textbackslash{,}}\{6;7;6.5\}]

**add-arc-degree-zero**

Zero-filling for the degree, minute or second parts of an arc is controlled using the add-arc-degree-zero, add-arc-minute-zero and add-arc-second-zero options. All are off as standard.

\[\text{\textbackslash{\text{\textbackslash{ang}}}(-1;;) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}}(-2;) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}};;-3) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{si}}}etup\{\text{\textbackslash{add-arc-degree-zero}}\}\text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}}-1;) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}};-2;) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}};-3) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{si}}}etup\{\text{\textbackslash{add-arc-minute-zero}}\}\text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}}-1;) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}};-2;) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}};-3) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{si}}}etup\{\text{\textbackslash{add-arc-second-zero}}\}\text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}}-1;) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}};-2;) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}};-3) \text{\textbackslash{\parallel}}}\]

**angle-symbol-over-decimal**

In some subject areas, most notably astronomy, the angle symbols are given over the decimal marker, rather than at the end of the number. This behaviour is available using the angle-symbol-over-decimal option.

\[\text{\textbackslash{\text{\textbackslash{ang}}}45.697) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}}6;7;6.5) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}}\{\text{\textbackslash{angle-symbol-over-decimal}}}45.697) \text{\textbackslash{\parallel}}}\]
\[\text{\textbackslash{\text{\textbackslash{ang}}}\{\text{\textbackslash{angle-symbol-over-decimal}}}\{6;7;6.5\} \text{\textbackslash{\parallel}}}\]
45.697°
6°7′6.5″
45:697
6° 7′ 6.5″
### 5.10 Creating units

The various macro units are created at the start of the document. `siunitx` can define these such that they are only available for use within the `\si` and `\SI` functions, or can make the unit macros available throughout the document body. There are a number of settings which control this creation process (Table 20). As a result, these options all apply in the preamble only.

The `free-standing-units` option controls whether the unit macros exist outside of the `\si` and `\SI` arguments. When this option is `true`, `siunitx` creates the macros for general use. The standard method to achieve this does not overwrite any existing macros: this behaviour can be altered using the `overwrite-functions` switch. When ‘free standing’ unit macros are created, their behaviour can be adjusted by a number of options. These are mainly intended for emulating the input syntax of older packages. The option `unit-optional-argument` gives the same behaviour for the inputs

\begin{itemize}
\item \SI{10}{\metre} \text{ and } \SI{10}{\meter}
\end{itemize}

The `space-before-unit` and `use-xspace` options control the behaviour at the ‘ends’ of the unit macros. Activating `space-before-unit` inserts the number–unit space before the unit is printed. This is suitable for the input syntax

\begin{itemize}
\item 30\metre
\end{itemize}

but does mean that the unit macros are incorrectly spaced in running text. On the other hand, the `use-xspace` option attempts to correctly space input such as

\begin{itemize}
\item \metre is the symbol for metres.
\end{itemize}

### 5.11 Loading additional units

As standard, `siunitx` loads a set of abbreviated versions of the SI units (Table 21). The standard `siunitx` settings only create these abbreviations within the scope of the `\si` and `\SI` functions, meaning that no clashes should occur (for example with the standard `\pm` symbol). Loading of these abbreviations can be prevented by setting the option `abbreviations = false` in the preamble.
Table 21 – Abbreviated units.

Binary data is expressed in units of bits and bytes. These are normally given
prefixes which use powers of two, rather than the powers of ten used by the SI prefixes.
As these binary prefixes are closely related to the SI prefixes, they are defined by
\texttt{siunitx} but do have to be loaded using \texttt{binary-units = true} (or simply \texttt{binary-units})
(Table 22). The units \texttt{\bit} and \texttt{\byte} are then also available.

\texttt{\SI{100}{\mebi\byte}} \texttt{\}] \texttt{\SI{30}{\kibi\bit}}

A configuration file is also included which will use settings and define macros as defined by version 1 of \texttt{siunitx}: this can be accessed with the option \texttt{version-1-compatibility}. This is intended to allow easy transition to version 2: users should update their source to use the new interfaces and functions.

Users upgrading from version 1 of \texttt{siunitx} will notice that the various ‘specialist’ units available in version 1 are no longer provided as loadable options. These are not included in version 2 as the criteria for inclusion of such units are far from clear, and it is difficult to justify providing clearly non-SI units in the package. For reference, appropriate definitions for the units which were provided in version 1 are as follows.

\footnote{They are included in the loaded configuration file \texttt{version-1}, but this is intended purely to ease transition to version 2.}

#### 5.12 Using units

Part of the power of \texttt{siunitx} is the ability to alter the output format for units without changing the input. The behaviour of units is therefore controlled by a number of options which alter either the processing of units or the output directly (Table 23).

Some users may prefer to completely disable the use of literal input in units, for example to enforce consistency. This can be accomplished by setting the \texttt{forbid-literal-units} switch. With this option enabled, only macro-based units can be used in a document.

The separator between each unit is stored using the \texttt{inter-unit-product} option. The standard setting is a thin space: another common choice is a centred dot. To get the correct spacing it is necessary to use \texttt{\ensuremath{{}\cdot{}}} in the latter case.

\begin{verbatim}
\texttt{\si{\farad\squared\lumen\candela}} \texttt{\textbackslash si[inter-unit-product = \texttt{\ensuremath{{}\cdot{}}}]\texttt{\farad}\texttt{\squared}\texttt{\lumen}\texttt{\candela}}
\end{verbatim}

The handling of \texttt{\per} is altered using the \texttt{per-mode} choice option. The standard setting is reciprocal, meaning that \texttt{\per} generates reciprocal powers for units. Setting the option to \texttt{fraction} uses the \texttt{\frac} function to typeset the positive and negative powers of a unit separately.

\begin{verbatim}
\texttt{\textbackslash si{\textbackslash joule\textbackslash per\textbackslash mole\textbackslash per\textbackslash kelvin}} \texttt{\textbackslash si{\textbackslash metre\textbackslash per\textbackslash second\textbackslash squared}} \texttt{\textbackslash si[\texttt{per-mode=fraction}]\texttt{\textbackslash joule\textbackslash per\textbackslash mole\textbackslash per\textbackslash kelvin}} \texttt{\textbackslash si[\texttt{per-mode=fraction}]\texttt{\textbackslash metre\textbackslash per\textbackslash second\textbackslash squared}}
\end{verbatim}

### J mol\textsuperscript{-1} K\textsuperscript{-1}

\texttt{\textbackslash m\textsuperscript{2}\textbackslash s}\textsuperscript{-2}

\texttt{\frac{\textbackslash m\textsuperscript{2}}{\textbackslash s}\textsuperscript{-2}}

The closely-related \texttt{reciprocal-positive-first} setting acts in the same way but places all of the positive powers before any negative ones.
It is possible to use a symbol (usually \( / \)) to separate the two parts of a unit by setting `per-mode` to `symbol`. The symbol used is stored using the setting `per-symbol`. This method for displaying units can be ambiguous, and so brackets are added unless `bracket-unit-denominator` is set to false. Notice that `bracket-unit-denominator` only applies when `per-mode` is set to `symbol` or `symbol-or-fraction`.

\[ \text{\textit{J}/(mol K)} \]
\[ \text{J}/(mol K) \]

The often-requested (but mathematically invalid) `repeated-symbol` option is also available to repeat the symbol for each \( \per \).

Finally, it is possible for the behaviour of the `\per` function to depend on the prevailing math style. Setting `per-mode` to `symbol-or-fraction` will use the symbol setting for in-line math, and the fraction setting when used in `displaystyle` math.

\[ \text{\textit{J}}/(\text{mol K}) \]
\[ \text{\textit{J}}/(\text{mol K}) \]

By default, `\per` applies only to the next unit given.\(^5\) By setting the `sticky-per` flag, this behaviour is changed so that `\per` applies to all subsequent units.

\(^5\)This is the standard method of reading units in English: for example, J mol\(^{-1}\) K\(^{-1}\) is pronounced 'joules per mole per kelvin'.

\text{power-font} \quad \text{The font used for the powers in units can be typeset using the current number or unit font. This may be of use when the \texttt{euler} package is loaded. Note that this setting applies to all printing options for numbers, including the color used for displaying the number.}

\text{literal-superscript-as-power} \quad \text{When printing units in 'literal' mode, it is possible that simply printing superscripts 'as is' may lead to poor appearance for the numbers. This is most likely if the text font of the document uses old style (lower case) numerals, but the math font uses lining (upper case) numerals. It is therefore possible to treat superscripts within literal units as powers, and thus for the power-font option to apply within these literal units. This behaviour is controlled using the literal-superscript-as-power switch.}

\text{qualifier-mode} \quad \text{Unit qualifiers can be printed in three different formats, set by the qualifier-mode option. The standard setting is subscript, while the options brackets, phrase, space and text are also possible. With the last settings, powers can lead to ambiguity and are automatically detected and brackets added as appropriate.}

\text{qualifier-phrase} \quad \text{The phrase setting for qualifier-mode uses the text stored using qualifier-phrase to separate the qualifier.}

\((\text{kgo}\text{fpol})^2 (\text{molofcat})^{-1} \text{h}^{-1}\)
\((\text{kgby}\text{pol})^2 (\text{molbycat})^{-1} \text{h}^{-1}\)

prefixes-as-symbols

The unit prefixes (\textit{kilo, etc.}) are normally given as letters. However, the package can convert these into numerical powers. This is controlled by the \textit{prefixes-as-symbols} switch option. This correctly deals with the kilogram, which is a base unit even though it involves a prefix.

\[
\text{\textit{si}}\{\text{milli} \text{litre} \text{per} \text{mole} \text{deci} \text{ampere}\} \quad \%

10\textsuperscript{-4} mol\textsuperscript{-1} A
10 \times 10\textsuperscript{-1} kg\textsuperscript{2} s

parse-units

Normally, \texttt{siunitx} is used with the unit parse enabled, and only prints units directly if there is literal input. However, if the input is known to be essentially consistent and high performance is desired, then the parser can be turned off using the \texttt{parse-units} switch.

300 MHz
\[
\text{\textit{SI}}\{\text{parse-units}=\text{false}\}\{300\}\{\text{MHz}\}
\]

5.13 Numbers with units

Some options apply to the combination of units and numbers, rather than to units or numbers alone (Table 24).

allow-number-unit-breaks

Usually, the combination of a number and unit is regarded as a single mathematical entity which should not be split across lines. However, there are cases (very long units, narrow columns, etc.) where breaks may be needed. This can be turned on using the \texttt{allow-number-unit-breaks} option.

Some filler text 10 m
\begin{minipage}{2.55 cm}
\%
\texttt{Gives an underfull hbox} \%
\texttt{Some filler text} \%\texttt{SI(10)}\{\text{metre}\} \%
\texttt{Some filler text} \%
\texttt{sisetup(allow-number-unit-breaks)} \%
\texttt{Some filler text} \%\texttt{SI(10)}\{\text{metre}\}
\end{minipage}
The product symbol between the number and unit is set using the \texttt{number-unit-product} option.

\SI{2.67}{\farad} \ \ \ \ \SI[\texttt{number-unit-product = }]{2.67}{\farad} \ \ \ \SI[\texttt{number-unit-product = }]{2.67}{\farad} \\
2.67 \text{ F} \ \ \ \ 2.67 \text{ F} \ \ \ \ 2.67 \text{ F}

When a number has multiple parts (such as a separate uncertainty) then the unit must apply to all parts of the number. How this is shown is controlled using the \texttt{multi-part-units} options. The standard setting is \texttt{brackets}, which will place the entire numerical part in brackets and use a single unit symbol. Alternative options are \texttt{repeat} (print the unit for each part of the number) and \texttt{single} (print only one unit symbol: mathematically incorrect).

\sisetup{\texttt{separate-uncertainty}}\ %  \\
\SI{12.3(4)}{\kilo\gram} \ \ \ \ \SI[\texttt{multi-part-units = brackets}]{12.3(4)}{\kilo\gram} \ \ \ \ SI[\texttt{multi-part-units = repeat}]{12.3(4)}{\kilo\gram} \ \ \ \ SI[\texttt{multi-part-units = single}]{12.3(4)}{\kilo\gram} \\
(12.3 \pm 0.4) \text{ kg} \ \ \ \ (12.3 \pm 0.4) \text{ kg} \ \\
12.3 \text{ kg} \pm 0.4 \text{ kg}  \\
12.3 \pm 0.4 \text{ kg}

It is important to notice that numbers with units are not affected by the setting of \texttt{bracket-numbers}, which applies to 'pure' numbers only. For example:

\sisetup{\texttt{separate-uncertainty,bracket-numbers = false}}\ %  \\
\num{1.234(5)e-4} \ \ \ \ \SI{1.234(5)e-4}{\metre} \\
1.234 \pm 0.005 \times 10^{-4} \ \ \ \ (1.234 \pm 0.005) \times 10^{-4} \text{ m}

The reason is that the requirements to bracket values with units are fundamentally different from those for numbers alone. Some combinations which are mathematically valid in the absence of a unit become invalid when a unit is present.

When a product of quantities is given, the resulting units can be displayed in a number of ways, set using the \texttt{product-units} option. The standard setting is \texttt{repeat}, which prints one unit symbol for each numbers. Alternatives are \texttt{brackets}, \texttt{brackets-power}, \texttt{power}, \texttt{repeat} and \texttt{single}. This option does not affect the application of brackets for each number within the product list: it only sets those around the entire list.

\SI{2 \times 3 \times 4}{\metre} \ \ \ \ \SI[\texttt{product-units = brackets}]{2 \times 3 \times 4}{\metre} \ \ \ \ SI[\texttt{product-units = brackets-power}]{2 \times 3 \times 4}{\metre} \ \ \ \ SI[\texttt{product-units = power}]{2 \times 3 \times 4}{\metre} \ \ \ \ SI[\texttt{product-units = repeat}]{2 \times 3 \times 4}{\metre} \ \ \ \ SI[\texttt{product-units = single}]{2 \times 3 \times 4}{\metre}
\(2 \times 3 \times 4 \text{ m} \)
\(2 \times 3 \times 4 \text{ m}^3\)
\(2 \times 3 \times 4 \text{ m}^3\)
\(2 \text{ m} \times 3 \text{ m} \times 4 \text{ m}\)
\(2 \times 3 \times 4 \text{ m}\)

**list-units** The list-units and range-units options determine how the \SIlist and \SIrange functions display units, respectively. The standard setting for both is repeat, where each number will be printed with a unit. Alternatives are brackets and single. Any brackets needed on individual numbers within a product are controlled by the brackets-numbers option (i.e. they are treated as pure numbers). These options do not affect the application of brackets for each number within the list or range: they only set those around the entire group.

\[
\SIlist{2; 4; 6; 8}{\text{tesla}} \\
\SIlist[list-units = brackets]{2; 4; 6; 8}{\text{tesla}} \\
\SIlist[list-units = repeat]{2; 4; 6; 8}{\text{tesla}} \\
\SIlist[list-units = single]{2; 4; 6; 8}{\text{tesla}} \\
\SIrange{2}{4}{\text{degreeCelsius}} \\
\SIrange[range-units = brackets]{2}{4}{\text{degreeCelsius}} \\
\SIrange[range-units = repeat]{2}{4}{\text{degreeCelsius}} \\
\SIrange[range-units = single]{2}{4}{\text{degreeCelsius}}
\]

2 T, 4 T, 6 T and 8 T
(2, 4, 6 and 8) T

2, 4, 6 and 8 T
2°C to 4°C
(2 to 4) °C
2°C to 4°C
2 to 4°C

**range-units**

When the exponent-to-prefix option is set true, the package will attempt to convert any exponents in quantities into unit prefixes, and will attach these to the first unit given. This process is only possible if the exponent is one for which a prefix is available, and retains the number of significant figures in the input.

\[
\SI{1700}{\text{g}} \\
\SI{1.7e3}{\text{g}} \\
\sisetup{exponent-to-prefix} \% \\

5.14 Tabular material

Processing of material in tables obeys the same settings as described for the functions already described. However, there are some settings which apply only to the layout of tabular material (Table 25).

The main use of the S column is to control the alignment of the resulting output. However, it is possible to turn off alignment entirely and only use the number parser of \texttt{siunitx}. This is achieved using the \texttt{table-parse-only} switch, as illustrated in Table 26.

\begin{table}
\centering
\caption{Parsing without aligning in an \texttt{S} column.}
\label{tab:S:parse}
\begin{tabular}{S S[table-parse-only]}
\toprule
{Decimal-centred} & {Simple centring} \\
\midrule
12.345 & 12.345 \\
\end{tabular}
\end{table}
Table 26 – Parsing without aligning in an S column.

<table>
<thead>
<tr>
<th>Decimal-centred</th>
<th>Simple centring</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.345</td>
<td>12.345</td>
</tr>
<tr>
<td>6.78</td>

</tr>
<tr>
<td>−88.8(9)</td>
<td>−88.8(9)</td>
</tr>
<tr>
<td>4.5 × 10³</td>
<td>4.5 × 10³</td>
</tr>
</tbody>
</table>

The alignment of numbers with the boundaries of the S column is controlled using the \texttt{table-number-alignment} option, which takes the values center-decimal-marker, center, left and right. The center-decimal-marker places the decimal marker for the number at the centre of the column. This does not need any information in advance, and so is the standard setting. It works best for approximately symmetrical input (equal numbers of digits before and after the decimal). On the other hand, the center, left and right options require space to be reserved for the numbers, and then use this fixed space to align with the edges of the column. The different alignment choices are illustrated in Table 27, which uses somewhat exaggerated column headings to show the relative position of the cell contents.
Table 27 – Aligning the $S$ column.

<table>
<thead>

</tr>
<tr>
<td>90.473</td>
<td>90.473</td>
<td>90.473</td>
<td>90.473</td>
</tr>
</tbody>
</table>

Many of the other table options do not apply when `table-number-alignment = center-decimal-marker` is set, as this mode always centres the marker at the expense of any other choices.

The space reserved by \texttt{siiunitx} for a number is controlled by two families of options. The first family cover the number of digits allowed for in different parts of the number, for example \texttt{table-figures-integer} controls the space for integer digits in the mantissa. If the number of figures is set to 0, then no space is reserved and some output will either be out of position or not printed at all (although a warning will result). Reserving space for a given part of number will automatically include space for any associated items (for example the ‘×‘ symbol for exponents). The second family of options are switches which govern whether space is reserved for a sign: \texttt{table-sign-exponent} and \texttt{table-sign-mantissa}. The effect of altering some of these settings is shown in Table 28.

```latex
\begin{table}
\caption{Reserving space in $S$ columns.}
\label{tab:S:space}
\sisetup{
table-number-alignment = center,
table-figures-integer = 2
}
\centering
\begin{tabular}{S|S|S|S|S}
\toprule
{Values} & {Values} & {Values} & {Values} & {Values} \\
\midrule
2.3 & 2.3 & 2.3(5) & 2.3(5) & 2.3 & 2.3e8 \\
34.23 & 34.23 & 34.23(4) & 34.23(4) & 34.23 & 34.23 \\
\end{tabular}
\end{table}
```
Table 28 – Reserving space in S columns.

<table>
<thead>
<tr>
<th>Values</th>
<th>Values</th>
<th>Values</th>
<th>Values</th>
<th>Values</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.3</td>
<td>2.3</td>
<td>2.3(5)</td>
<td>2.3 ± 0.5</td>
<td>2.3</td>
<td>2.3 × 10^8</td>
</tr>
<tr>
<td>34.23</td>
<td>34.23</td>

<td>34.23 ± 0.04</td>
<td>34.23</td>
<td>34.23</td>
</tr>
<tr>
<td>56.78</td>
<td>56.78</td>
<td>56.78(3)</td>
<td>56.78 ± 0.03</td>
<td>−56.78</td>
<td>56.78 × 10^3</td>
</tr>
<tr>
<td>3.76</td>
<td>3.76</td>
<td>3.76(2)</td>
<td>3.76 ± 0.02</td>
<td>±3.76</td>
<td>10^0</td>
</tr>
</tbody>
</table>

Space can also be reserved in a table for a comparator (greater than, less than, table-comparator and so forth). This is activated using the table-comparator switch (Table 29).

The table-printing code will omit any part of a number which has no space reserved, placing a warning in the \LaTeX log. This means that uncertainties and exponents will not be printed if no space is reserved for them.

As a short cut for the preceding options, \texttt{siunitx} also provides the table-format option. This can be used to give the same information about the space to reserve for a number in a ‘compressed’ manner. The input to table-format should consist of a number showing how many figures to reserve in each part of the input. Thus

\sisetup{
  table-format = 3.2
}
Table 29 – Reserving space for comparators in $S$ columns.

<table>
<thead>
<tr>
<th>Values</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>$2.3$</td>
<td>$&lt; 2.3 \times 10^8$</td>
</tr>
<tr>
<td>$34.23$</td>
<td>$=34.23$</td>
</tr>
<tr>
<td>$56.78$</td>
<td>$\geq 56.78 \times 10^3$</td>
</tr>
<tr>
<td>$3.76$</td>
<td>$\gg 10^6$</td>
</tr>
</tbody>
</table>

is equivalent to

```latex
\sisetup{
  table-figures-integer = 3,  
  table-figures-decimal = 2
}
```

The `table-format` option will also correctly interpret the presence of a sign, so that

```latex
\sisetup{
  table-format = +3.2e+4
}
```

will have the same effect as

```latex
\sisetup{
  table-figures-integer = 3,  
  table-figures-decimal = 2,  
  table-figures-exponent = 4,  
  table-sign-mantissa,  
  table-sign-exponent
}
```

It is important to note that any parts of a number not specified in the table format argument are set to be absent (the number of figures is set to zero). Setting the `table-format` option also resets `table-number-alignment` to center (Table 30).
### Table 30 – Using the table-format option.

</tr>
</tbody>
</table>

When printing exponents in tables, there is a choice of aligning the exponent parts or having these close up to the mantissa. This is controlled by the `table-align-exponent` option (Table 32). Similarly, uncertainty parts which are printed separately from the mantissa can be aligned or closed up. This is set by the `table-align-uncertainty` option (Table 33). Finally, the same approach is available for the comparator with the `table-align-comparator` option (Table 34).
Table 31 – Text before and after numbers.

    1.234(5) & 1.234(5) \\
    \bottomrule
  \end{tabular}
\end{table}
In cases where data cover a range of values, printing using a fixed exponent in a table may make presentation clearer. In these cases, omitting the exponent value from the table is useful. The package offers the `table-omit-exponent` option to do this (Table 35); this automatically sets `scientific-notation = fixed` for the table column.
Table 35 – The table-omit-exponent option

<table>
<thead>
<tr>
<th>Header</th>
<th>Header / $10^3$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$1.2 \times 10^3$</td>
<td>1.2</td>
</tr>
<tr>
<td>$3 \times 10^2$</td>
<td>0.3</td>
</tr>
<tr>
<td>$1.0 \times 10^4$</td>
<td>10</td>
</tr>
</tbody>
</table>

Note markers are often given in tables after the numerical content. It may be desirable for these to close up to the numbers. Whether this takes place is controlled by the `table-align-text-pre` and `table-align-text-post` option (Table 36).

```latex
\begin{table}
\caption{Closing notes up to text.}
\label{tab:S:notes}
\newrobustcmd\NoteMark[1]{{\textsuperscript{\emph{#1}}}}
\sisetup{
  table-number-alignment = center,
  table-figures-integer = 2,
  table-figures-decimal = 4,
  table-space-text-pre = \NoteMark{a}
}
\begin{tabular}{SS[table-align-text-pre = false]}
\toprule
{Values} & {Values} \\
\midrule
2.3456 & 2.3456 \\
\NoteMark{a} 4.234 & \NoteMark{a} 4.234 \\
\NoteMark{b} .78 & \NoteMark{b} .78 \\
\NoteMark{d} 88 & \NoteMark{d} 88 \\
\bottomrule
\end{tabular}
\sisetup{table-space-text-post = \NoteMark{a}}
\begin{tabular}{SS[table-align-text-post = false]}
\toprule
{Values} & {Values} \\
\midrule
2.3456 & 2.3456 \\
\NoteMark{a} 34.234 & \NoteMark{a} 34.234 \\
34.234 & \NoteMark{a} 34.234 \\
\bottomrule
\end{tabular}
\end{table}
```

</table>

The contents of table cells can automatically be rounded or zero-filled to the number of decimal digits given for the \texttt{table-figures-decimal} option. This mode is activated using the \texttt{table-auto-round} switch, as illustrated in Table 37.

\begin{table}
\centering
\caption{The \texttt{table-auto-round} option.}
\label{tab:S:auto}
\sisetup{
  table-number-alignment = center,
  table-figures-integer = 1,
  table-figures-decimal = 3
}
% Notice the overfull hbox which results with
% the first column
\begin{tabular}{SS[table-auto-round]}
\toprule
\{Header\} & \{Header\} \\
\midrule
1.2        & 1.2     \\
1.2345     & 1.2345  \\
\bottomrule
\end{tabular}
\end{table}

When the \texttt{parse-numbers} option is set to \texttt{false}, then the alignment code for tables takes a different approach. The output is always set in math mode, and alignment takes place at the first decimal marker. This is achieved by making it active in math mode. When reserving space for content only the integer and decimal values for the mantissa are considered (Table 38).

\begin{table}

\end{table}

</tbody>
</table>

The contents of \texttt{s} columns can be centred or aligned to the left or right using the \texttt{table-unit-alignment} option. As for the other alignment options, this recognises the choices \texttt{center}, \texttt{left} and \texttt{right}.

\begin{table}
  \centering
  \caption{Alignment options in \texttt{s} columns.}
  \label{tab:s:align}
  \begin{tabular}{\texttt{s} \texttt{s} \texttt{s}}
    \toprule
    \texttt{Right-aligned} & \texttt{Centred text} & \texttt{Left-aligned} \\
    \midrule
    55 & 55 & 55 \\
    \bottomrule
  \end{tabular}
\end{table}
The three table alignment options (table-number-alignment, table-text-alignment and table-unit-alignment) can be set to the same value using the table-alignment option. This will set all three alignment options to the same value (one of center, right or left).

Usually, the width of the S and s columns is allowed to vary depending on the content. However, there are cases where a strictly fixed width is desirable. For these cases, the table-column-width option is available. The standard setting, 0 pt, indicates that no fixing takes place. If a value is set for this option then the tabular material is typeset to the specified width (Table 41).

The table-column-width option can also be used to achieve special effects. One example is centring a column of numbers under a wide heading, with the numbers themselves right-aligned (Table 42).
Table 41 – Fixed-width columns.

\end{table}

5.15 Symbols

Most units use letters as the symbol for the unit, and these are all very easy to control. However, a small number of units use other symbols, and matching these to the body text requires more work. \texttt{siunitx} provides appropriate symbols for commonly-used units, but the definitions may need adjustment depending on the body font used in a document.

The package provides one general option for the handling of symbols. If the packages \texttt{textcomp} or \texttt{upgreek} are loaded, symbols can be taken from these for units, rather than using the \texttt{siunitx} default values. The switch \texttt{redefine-symbols} can be used to turn this behaviour on or off: the standard setting is \texttt{true}. 

57
The individual symbols are set up independently for math and text output, and are summarised in Table 43. Many of the definitions are variations using \text or \ensuremath to produce the correct output, as the symbols available in the document may vary considerably. In the case of the micro symbol (µ), \siunitx provides a suitable low-level definition for the symbol. Depending on the fonts available, this may need to be replaced by an alternative by the user. The ohm symbol (Ω) is usually set to \Omega, but will check that this has not been redefined as a slanted letter. If \Omega has been redefined, an alternative definition is used.

The math and text symbols defined above are wrapped up into mode independent functions with user names. These are then used in the definitions of the appropriate units. For example, the micro symbol can be accessed using the macro \SIUnitSymbolMicro. Notice that these names capitalise the unit name (to make reading the macro name easier).\footnote{The function \SIUnitSymbolAngstrom uses the name without accents.}

When using \TeX or \LaTeX, if fontspec is loaded these options are redefined to use UTF-8 characters directly.

### 5.16 Other options

#### locale
\siunitx allows the user to switch between the typographic conventions of different (geographical) areas by using locales. Currently, the package is supplied with configurations for locales UK, US, DE (Germany), FR (French) and ZA (South Africa). The locale option is used to switch to a particular locale.

\begin{verbatim}
1.234 m \SI{1.234}{\metre} \SI[locale = DE]{1.234}{\metre}
6,789 m \SI{6.789}{\metre} \SI[locale = DE]{6.789}{\metre}
\end{verbatim}
could be made complicated if the options for non-standards behaviour could not be turned off. The preamble-only option strict resets package behaviour to follow the rules closely, and disables options which deviate from this. If the package is loaded with the strict option, all output is made using the upright (serif) font.

5.17 Local configurations

The \siunitx package will check for a local configuration file \texttt{siunitx.cfg} during package loading. This occurs before applying any setting given in the optional argument to \texttt{\usepackage}. A typical configuration file may include settings (using \texttt{\sisetup}) and locally-defined units, for example

\ProvidesFile{siunitx.cfg}
\sisetup{
   output-decimal-marker = {,},
   per-mode = symbol,
}
\DeclareSIUnit{torr}{torr}

As units are always declared, overwriting any existing definition, units may safely be created in the configuration file even when also included in individual \LaTeX document headers.

Installing a local configuration file on your system is very much like doing a local installation of a package. The exact method depends on the \TeX system in use. For advice on this, a good start is the TeX.SX question on local installation.

6 Localisation

The \translator package provides a structured framework for localisation of words and phrases, and is part of the larger \texttt{beamer} bundle. The \translator package provides the \texttt{\translate} macro, which will provide appropriate translations based on the current \texttt{babel} or \texttt{polyglossia} language setting.

If \translator is available, \siunitx will load it and alter the standard settings for the list-final-separator and range-phrase options to read:

\sisetup{
   list-final-separator = { \translate{and} },
   list-pair-separator = { \translate{and} },
   range-phrase = { \translate{to (numerical range)} },
}

If the current language is known to the \translator package then the result will be localised text. The preamble for this manual loads English, French, German and Spanish as options, and also loads the \texttt{babel} package:
Note that the in order for this to work correctly, languages should be given as global (class) options rather than as package options for \texttt{bịch}.

## 7 Hints for using \texttt{siunitx}

### 7.1 Ensuring text or math output

The macros \texttt{\ensuremath} and \texttt{\text} should be used to ensure that a particular item is always printed in the desired mode. Some mathematical output does not work well in \texttt{\texttt{mathrm}} (the standard font used by \texttt{siunitx} for printing). The easiest way to solve this is to use the construction \texttt{\text\texttt{\ensuremath{...}}}, which will print the material in the standard mathematics font without affecting the rest of the output. In some cases, simply forcing \texttt{\mathnormal} will suffice, but this is less reliable with non-Latin characters.

### 7.2 Expanding content in tables

When processing tables, \texttt{siunitx} will expand anything stored inside a macro, unless it is long or protected. \LaTeX{} robust commands are also detected and are not expanded (Table~44). Values which would otherwise be expanded can be protected by wrapping them in a set of braces. As \TeX{} itself will expand the first token in a table cell before \texttt{siunitx} can act on it, using the \texttt{\LaTeX} protected mechanism is the recommended course of action to prevent expansion of macros in table cells. (As is shown in the table, \TeX{}'s expansion of \LaTeX{} robust commands can lead to unexpected results.)

\begin{verbatim}
\begin{table}
  \centering
  \caption{Values as macros in \texttt{S} columns.}
  \label{tab:xmpl:macro}
  \newcommand*{\myvaluea}{1234}
  \newcommand{\myvalueb}{1234}
  \DeclareRobustCommand*{\myvaluec}{1234}
  \protected\def{\myvalued}{1234}
  \begin{tabular}{S}
    \toprule
    \{Some Values}\n    \midrule
    \myvaluea 8.8 \myvaluea \% Both expanded
    \myvalueb 8.8 \myvalueb \% First expanded by \TeX
  \end{tabular}
\end{table}
\end{verbatim}
Table 44 – Values as macros in $S$ columns.

<table>
<thead>
<tr>
<th>Some Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>12348.81234</td>
</tr>
<tr>
<td>12348.8</td>
</tr>
<tr>
<td>12348.1234</td>
</tr>
<tr>
<td>12348.1234</td>
</tr>
<tr>
<td>12348.81234</td>
</tr>
<tr>
<td>12348.8</td>
</tr>
</tbody>
</table>

\% to numbers

\% First expanded by TeX
\% but not to numbers!
\% Neither expanded
\% Neither expanded

\bottomrule
\end{tabular}
\end{table}

It is possible to use calculated values in tables. For this to work, the calculation must take place before attempting to parse the number. An added complication is that TeX itself will expand the first macro in a table cell until it finds something unexpandable. The \texttt{\varepsilon-TEX} protected mechanism can be used to prevent this; using the \texttt{etoolbox} package provides a convenient way to apply this protection to existing functions. The general approach is illustrated in Table 45. The macro \texttt{\DTLmul} is made robust inside the table using the \texttt{\robustify} command from \texttt{etoolbox}, before constructing the table using an extra column to contain the calculation.
Table 45 – Calculated values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Doubled</th>
</tr>
</thead>
<tbody>
<tr>
<td>66.7012</td>
<td>133.402 400 000</td>
</tr>
<tr>
<td>66.0212</td>
<td>132.042 400 000</td>
</tr>
<tr>
<td>64.9026</td>
<td>129.805 200 000</td>
</tr>
</tbody>
</table>

Table 46 – Displaying a datatool table.

\begin{table}
\centering
\sisetup{
  parse-numbers = false,
  table-number-alignment = center,
  table-figures-integer = 2,
  table-figures-decimal = 4
}
\renewcommand*{\dtlrealalign}{S}
\DTLmul{myvalue}{myvalue}{2} myvalue \% second column & \\
\bottomrule
\end{tabular}
\end{table}

7.3 Using siunitx with datatool

As illustrated in Table 45, siunitx can be used to typeset data stored using datatool. For quickly displaying the contents of tables, datatool offers the \DTLshowtable macro. This will only work with S columns if number parsing is turned off (Table 46).

\DTLnewdb{moredata}
\DTLnewrow{moredata}\DTLnewdbentry{moredata}{value}{ 6.7012}
\DTLnewrow{moredata}\DTLnewdbentry{moredata}{value}{66.0212}
\DTLnewrow{moredata}\DTLnewdbentry{moredata}{value}{64.902}
\begin{table}
\caption{Displaying a \textsf{datatool} table.}
\label{tab:xmpl:datatool}
\sisetup{
  parse-numbers = false,
  table-number-alignment = center,
  table-figures-integer = 2,
  table-figures-decimal = 4
}
\renewcommand*{\dtlrealalign}{S}
\DTLdisplaydb{moredata}
\end{table}

7.4 Using units such as $\mu$m s$^{-1}$ in headings

The siunitx code is designed to work correctly with functions in headings. They will print correctly in headings and in the table of contents. As illustrated here, the standard
behaviour is to ignore font changes. When the hyperref package is loaded, the functions automatically ‘degrade gracefully’ to produce useful information in PDF bookmarks.

If you want more control over the bookmark text, use the \textorpdfstring function from hyperref, for example:

```latex
\section{Some text}
\textorpdfstring
{\si{joule\per\mole\per\kelvin}}
{J mol\textsuperscript{-1} K\textsuperscript{-1}}%
```

7.5 A left-aligned column visually centred under a heading

When you have a column of non-related numbers, the usual advice is to make these left-aligned and then centre the resulting column under the heading. With the dcolumn package, that would be done with something like \( d(x) \{5.0 \}. \) This is something of an abuse of the nature of a number, but can also be done using siunitx (47).

```latex
\begin{table}
\caption{Formatting unrelated numbers}
\label{tbl:xmpl:unrel}
\centering
\begin{tabular}{S[table-format = 5.0, parse-numbers = false, input-symbols=., input-decimal-markers = x]}
\toprule
\multicolumn{1}{c}{Header} \\
\midrule
120 \\
12.3 \\
12340 \\
12.02 \\
123 \\
1 \\
\bottomrule
\end{tabular}
\end{table}
```

7.6 Symbols and X\LaTeX

A small number of non-Latin symbols are needed by siunitx, notably \( \Omega \) and \( \mu \). The package picks glyphs for these which are correct in the sense that they are upright (not italic) symbols, and match the \LaTeX standard Computer Modern font. However, this does not make them the best choice if other fonts are in use, which is particularly common when X\LaTeX is being used.
Xe\TeX users will probably need to choose appropriate symbols themselves. The correct choice depends on the fonts in use, but many system fonts include Greek letters and other symbols (which is not the case with most \TeX-specific fonts). An appropriate setting could then be to use the text $\mu$ symbol in all cases:

\sisetup{
  math-micro = \text{$\mu$},
  text-micro = $\mu$
}

It may also be desirable in these cases to select a fixed font using the \textsf{fontspec} package, for example

\sisetup{
  math-micro = \fontspec{Minion Pro} \textmu ,
  text-micro = \fontspec{Minion Pro} \textmu
}

### 7.7 Scaled document fonts with Xe\TeX

The \textsf{fontspec} package makes it possible to scale the document body font. This can lead to unexpected problems with printing for \textsf{siunitx}, as some symbols will not scale while numbers and text will. The problem is best avoided by forcing \textsf{siunitx} to use the default math font for all output:

\sisetup{
  mode = math,
  math-rm = \ensuremath
}

This will cause all \textsf{siunitx} output not to scale at all, consistent with other mathematical content.

### 7.8 Interaction with \texttt{tex4ht}

\textsf{siunitx} will detect when \texttt{tex4ht} is in use, and makes some changes to the way output is printed. Text mode printing is automatically selected, and certain items (such as spaces) are printed in text mode rather than as math. This is designed to reduce the likelihood of spurious formulae appearing in, for example, output converted to OpenOffice format.
7.9 Maximising performance

Both the number and unit parsers require significant effort in terms of \TeX{} programming. For input that does not require such processing, the maximum performance for \texttt{siunitx} can therefore be obtained by turning off both systems:

\begin{verbatim}
\SI{7.3}{\Hz} \ \SI{7.3}{\Hz} \ \SI{7.3}{\Hz}
\end{verbatim}

7.10 Transferring settings to \texttt{pgf}

The numerical engine in the \texttt{pgf} package has settings similar to those in \texttt{siunitx}. To enable working with both packages easily, the macro \texttt{\SendSettingsToPgf} is available. It will set some commonly-used numerical formatting options in \texttt{pgf} to the current values used by \texttt{siunitx} to make using the two packages together more convenient for end users. This function can be used at any point after loading both the \texttt{pgf} and \texttt{siunitx} packages.

\begin{verbatim}
\documentclass{article}
\usepackage{pgf,siunitx}
\sisetup{...}
\SendSettingsToPgf
...
\end{verbatim}

7.11 Using \texttt{siunitx} with the \texttt{cellspace} package

Both \texttt{siunitx} and \texttt{cellspace} use the letter \texttt{S} for a new column type. This obviously leads to a problem. If both are loaded, \texttt{siunitx} will retain the \texttt{S} column, and moves the functionality of \texttt{cellspace} to the letter \texttt{C}. This allows the normal use of \texttt{cellspace} with standard column types: it does not work with the \texttt{siunitx} \texttt{S} or \texttt{s} columns.

7.12 Special considerations for the \texttt{\kWh} unit

The abbreviations configuration file provides the unit \texttt{\kWh}, which is set up with no spacing between the ‘kW’ and the ‘h’ unit to give ‘kWh’. However, this only applies when the unit is given on its own: combinations will follow the normal rules

\begin{verbatim}
kWh \ \si{\kWh} \ \si{\kWh}\per\metre}
\end{verbatim}

This is because the unit \texttt{\kWh} is defined so that it can still be varied by altering \texttt{kilo}, \texttt{watt} and \texttt{hour}, and so that the prefix can still be turned into a number. However, some users may prefer to have a non-flexible macro which never adds a space. This can be achieved by redefining \texttt{\kWh} with \texttt{\DeclareSIUnit}, by added an alternative definition

\begin{verbatim}
\DeclareSIUnit{\kWh}{kWh}
\DeclareSIUnit{\KWH}{kWh}
\end{verbatim}
or of course by using literal unit input.

\( \text{kWh m}^{-1} \quad \text{\textbackslash si\{\text{KWH}\textbackslash per\text{\textbackslash metre}\}} \)
\( \text{kWh m}^{-1} \quad \text{\textbackslash si\{\text{kWh}\textbackslash m}^{-1}\} \)

Another point to notice is that the \textbackslash per macro applies to the next unit, and not an entire unit combination. Thus in

\( \text{cd kW}^{-1} \text{h} \quad \text{\textbackslash si\{\text{candela}\textbackslash per\text{kWh}\}} \)
\( \text{\textper} \) applies to the watts but not to the hours. In this case, the units need to be written out in full or the \texttt{sticky-per} option should be used.

\( \text{\textbackslash si\{\text{candela}\textbackslash per\text{kilo\textbackslash watt\textbackslash per\text{\textbackslash hour}\}} \quad \text{\textbackslash si\{\text{sticky-per}\}\{\text{candela}\textbackslash per\text{kWh}\}} \)
\( \text{cd kW}^{-1} \text{h}^{-1} \)
\( \text{cd kW}^{-1} \text{h}^{-1} \)

### 7.13 Adding items after the last column of a tabular

When using the \texttt{array} package `<` construct to insert material after an \texttt{S} or \texttt{s} column, the alignment of the final column may be wrong if the standard tabular row terminator `\` is used. This is due to the way that \LaTeX{} constructs tables at a low level. The incorrect spacing can be avoided by using the \TeX{} `\cr` primitive to end the table rows (Table 48).

\begin{verbatim}
\begin{table}
  \caption{Correcting spacing in last \texttt{S} column}
  \label{tab:cr}
  \hfil
  \begin{tabular}{S<{\,\textbackslash si\{\text{kg}\}}S<{\,\textbackslash si\{\text{kg}\}}}
    \toprule
    \multicolumn{1}{c}{Long header} & \multicolumn{1}{c}{Long header} \\
    \midrule
    1.23 & 1.23 \\
    4.56 & 4.56 \\
    7.8 & 7.8 \\
    \bottomrule
  \end{tabular}
  \hfil
  \begin{tabular}{S<{\,\textbackslash si\{\text{kg}\}}S<{\,\textbackslash si\{\text{kg}\}}}
    \toprule
    \multicolumn{1}{c}{Long header} & \multicolumn{1}{c}{Long header} \\
    \midrule
    1.23 & 1.23 \texttt{\cr}
    4.56 & 4.56 \texttt{\cr}
    7.8 & 7.8 \texttt{\cr}
    \bottomrule
  \end{tabular}
  \hfil
\end{tabular}
\end{verbatim}

66
7.14 Creating a column with numbers and units

Usually, numbers in a table should be given with the units in the column heading. However, there are cases where a series of data are best presented in a table but have different units. There are two ways to do this (Table 49). The first is to place the units in the first column of the table, which makes sense if there are several related items in the table. The second method is to generate two columns, one for numbers and a second for units, and then to format these to give the visual effect of a single column. The later effect is most appropriate when only one set of numbers are presented in a table.

\begin{table}
\caption{Tables where numbers have different units}
\label{tab:xmpl:mixed}
\hfil
\begin{tabular}
{>{\$}l<{$}S[table-format = 2.3(1)]S[table-format = 3.3(1)]}
\toprule
& {One} & {Two} \\
\midrule
a / \si{\angstrom} & 1.234(2) & 5.678(4) \\
\beta / \si{\degree} & 90.34(4) & 104.45(5) \\
\mu / \si{\per\mm} & 0.532 & 0.894 \\
\bottomrule
\end{tabular}
\hfil
\begin{tabular}
{S[table-format=1.3]@{,}S[table-unit-alignment = left]}
\toprule
\multicolumn{2}{c}{Heading} \\
\midrule
1.234 & \metre \\
0.835 & \candela \\
4.23 & \joule\per\mole \\
\bottomrule
\end{tabular}
\hfil
\end{table}

</tbody>
</table>

7.15 Tables with heading rows

A common format for tables is to make the heading row visually distinct using a background colour and bold text. If numbers appear in such a heading row within an $S$ column then getting the appearance right can be challenging. The best approach is to make the \texttt{bfseries} macro ‘robust’ (as demonstrated in Section 7.2), then to use this macro to make the heading cells bold. This approach is illustrated in Table 50, along with the use of \texttt{rowcolor} to provide a background colour.

\begin{table}
\centering
\begin{tabular}{S\{detect-weight,table-format = 3.3\}}
\rowcolor{gray}{0.9}
\bfseries 123.456 \\
23.45 \\
123.4 \\
3.456 \\
\end{tabular}
\caption{Header row in a table}
\label{tab:xmpl:headers}
\end{table}

7.16 Associating a locale with a \texttt{babel} language

It is possible to instruct the \texttt{babel} package to switch to a particular \texttt{siunitx} locale when changing language. This can be done using the \texttt{babel extras\{language\}} system. For example, to associate the DE locale with the \texttt{german} \texttt{babel} language, the appropriate code would be

\begin{verbatim}
\addto\extrasgerman{\sisetup{locale = DE}}
\end{verbatim}
8 Information for those upgrading

8.1 Upgrading from version 1

The key-value control system of siunitx has been completely rewritten for version 2, and at the same time some of the macros provided by the package have been renamed and reworked. The package can be loaded with a configuration file to provide most of the same options and defaults as in version 1:

\usepackage[version-1-compatibility]{siunitx}

Many of the options from version 1 map to similar ones in version 2 (Table 51). The correspondence often includes a syntax change: consult details of the new options for the correct syntax for the new options. In some cases, the new approach is different to the older one, and in these cases the most appropriate option new has been listed in the table.

Continued on next page
A small number of the options from version 1 are used unchanged in version 2, for example the mode setting. These are listed above but require no action on the part of the user. There are also a few options which are no longer used at all, and are therefore ignored by the current code.

Loading configuration files has been completely changed, and this means that the options also load, load and no load are ignored by version 2. In the same way the options debug and log are not used by the current release of siunitx, as this information is usually only needed by the package author. Emulation of older packages is no longer offered (it was intended to help with the transition form earlier packages), and so the emulate option no longer applies.

8.2 Upgrading from version 2.0 or 2.1

User feedback on siunitx means that over time some renaming takes place. The following functions and options have been deprecated in version 2.2. They are therefore available in version 2.2, but should be replaced in new or updated documents with the successor names.

\begin{itemize}
\item angle-unit-separator
\item inter-unit-separator
\item number-unit-separator
\end{itemize}

These options have been replaced by the options

\begin{itemize}
\item angle-unit-product
\item inter-unit-product
\item number-unit-product
\end{itemize}

as these items are formally products, and the new option names emphasise this.

The \DeclareSIUnitWithOptions function has been extended to take a first optional argument, which removes the need for \DeclareSIUnitWithOptions. This function is therefore depreciated but retained for compatibility.

8.3 Upgrading from version 2.2

The option load-configurations has been deprecated in favour of the three options abbreviations, binary-units and version-1-compatibility. At the same time, loading of the abbreviations is now the standard behaviour, and so in most cases no explicit configuration file loading will be needed.
The digit grouping options have been revised, and the options `group-decimal-digits` and `group-integer-digits` are now integrated into `group-digits`. At the same time, the `group-four-digits` option has been extended to the new option `group-minimum-digits`.

The new `literal-superscript-as-power` option means that the standard behaviour now uses the current math font for superscripts, even when units are printed literally. This will only be obvious in documents such as this manual, where the text and math mode numerals are (deliberately) different. To restore the previous behaviour, set `literal-superscript-as-power = false`.

8.4 Upgrading from version 2.3

The number of options which assume that the input is given in math mode has been significantly reduced. As most material can be typeset in either math or text mode, the 'intrinsic' math mode options could lead to inconsistent output. The only options which now force math mode are those for products, which will almost always require the use of math mode.

8.5 Upgrading from version 2.4

The process of removing options which assume math mode, begun with version 2.4, has been taken further, and only `output-product` and `exponent-product` now do not require \	exttt{\ensuremath} for material which must be in math mode. The standard settings have been altered to take account of this, but user-set options for products may need to be updated accordingly.

8.6 Upgrading from version 2.5

All printing now takes place in math mode (\textit{i.e.} \texttt{mode = math} is set). This may alter the appearance of some units, and users may want to verify the output is correct.

9 Correct application of (SI) units

Consistent and logical units are a necessity for scientific work, and have applicability everywhere. Historically, a number of systems have been used for physical units. SI units were introduced by the \textit{Conférence Générale des Poids et Mesures} (CGPM) in 1960. SI units are a coherent system based on seven base units, from which all other units may be derived.

At the same time, physical quantities with units are mathematical entities, and as such way that they are typeset is important. In mathematics, changes of type (such as using bold, italic, sans serif typeface and so on) convey information. This means that rules exist not only for the type of units to be used under the SI system, but also the way they should appear in print. Advice on best practice has been made available by the \textit{National Institute of Standards and Technology} (NIST) \cite{nist}.

As befits an agreed international standard, the full rules are detailed. It is not appropriate to reproduce these in totality here; instead, a useful summary of the key points is provided. The full details are available from the \textit{Bureau International des Poids et Mesures} \cite{bipm}.

\texttt{siunitx} takes account of the information given here, so far as is possible. Thus the package defaults follow the recommendations made for typesetting numbers and
units. Spacing and so forth is handled in such a way as to make implementing the rules (relatively) easy.

### 9.1 Units

There are seven base SI units, listed in Table 1. Apart from the kilogram, these are defined in terms of a measurable physical quantity needing the definition alone. The base units have been chosen such that all physical quantities can be expressed using an appropriative combination of these units, needing no others and with no redundancy. The kilogram is slightly different from the other base units as it is still defined in terms of a ‘prototype’ held in Paris.

All other units within the SI system are regarded as ‘derived’ from the seven base units. At the most basic, all other SI units can be expressed as combinations of the base units. However, many units (listed in Tables 2 and 3) have a special name and symbol. Most of these units are simple combinations of one or more base units (raised to powers as appropriate). A small number of units derived from experimental data are allowed as SI units (Table 4).

A series of SI prefixes for decimal multiples and sub-multiples are provided, and can be used as modifiers for any SI unit (either base or derived units) with the exception of the kilogram. The prefixes are listed in Table 6. No space should be used between a prefix and the unit, and only a single prefix should be used. Even the degree Celsius can be given a prefix, for example 1 m°C.

It is important to note that the kilogram is the only SI unit with a prefix as part of its name and symbol. Only single prefix may be used, and so in the case of the kilogram prefix names are used with the unit name ‘gram’ and the prefix symbols are used with the unit symbol g. For example $1 \times 10^{-6}$ kg = 1 mg.

The application of SI units is meant to provide a single set of units which ensure consistency and clarity across all areas. However, other units are common in many areas, and are not without merit. The units provided by \texttt{siunitx} by default do not include any of these; only units which are part of the SI set or are accepted for use with SI units are defined. However, several other sets of units can be loaded as optional modules. The binary prefixes and units (Table 22) are the most obvious example. These are not part of the SI specifications, but the prefix names are derived from those in Table 6.

Other units are normally to be avoided where possible. SI units should, in the main, be preferred due to the advantages of clear definition and self-consistency this brings. However, there will probably always be a place for specialist or non-standard units. This is particularly true of units derived from basic physical constants.

There are also many areas where non-standard units are used so commonly that to do otherwise is difficult or impossible. For example, most synthetic chemists measure the pressure inside vacuum apparatus in mmHg, partly because the most common gauge for the task still uses a column of mercury metal. For these reasons, \texttt{siunitx} does define non-SI units.

### 9.2 Mathematical meaning

As explained earlier, a number–unit combination is a single mathematical entity. This has implications for how both the number and the unit should be printed. Firstly, the

---

7Some base units need others defined first; there is therefore a required order of definition.
two parts should not be separated: a quantity is a product of the number and the unit. With the exception of the symbols for plane angles (°, ′ and ″), the BIPM specifies either a space or half-height (centred) dot should be used [1].

A space for \SI{10}{\percent}\*
and also for \SI{100}{\degreeCelsius}\*
but not for \ang{1.23}.
A space for 10\%
and also for 100°C
but not for 1.23°.

The mathematical meaning of units also means that the shape, weight and family are important. Units are supposed to be typeset in an upright, medium weight font. Italic, bold and sans serif are all used mathematically to convey other meanings. (In an all sans serif document, using sans serif for units is reasonable.) The \texttt{siunitx} package defaults again follow this convention: any local settings are ignored, and uses the current upright math font. However, there are occasions where this may not be the most desirable behaviour. A classic example would be in an all-bold section heading. As the surrounding text is bold, some people feel that any units should follow this.

Units should \textbf{not be bold}: \SI{54}{\farad}\*
But perhaps in a running block, it might look better: \SI{[detect-weight]{54}{\farad}}
Units should \textbf{not be bold}: 54 F
But perhaps in a running block, it might look better: 54 F

Symbols for units formed from other units by multiplication are indicated by means of either a half-height (that is, centred) dot or a (thin) space.

\begin{verbatim}
\texttt{\si{\metre\second} = \text{metre second} \texttt{\si{\milli\second} = \text{millisecond}} \texttt{\sisetup{inter-unit-product = \ensuremath { { } \cdot { } } } \texttt{\si{\metre\second} = \text{metre second} \texttt{\si{\milli\second} = \text{millisecond}} \texttt{m s = metre second} \texttt{ms = millisecond} \texttt{m \cdot s = metre second} \texttt{ms = millisecond}}
\end{verbatim}

There are some circumstances under which it is common practice to omit any spaces. The classic example is kWh, where ‘kWh’ does not add any useful information. If using such a unit repeatedly, users of \texttt{siunitx} are advised to create a custom unit to ensure consistency. It is important to note that while this is common practice, it is not allowed by the BIPM [1].

Symbols for units formed from other units by division are indicated by means of a virgule (oblique stroke, slash, /), a horizontal line, or negative exponents.\footnote{Notice that a virgule and a solidus are not the same symbol.} However, to avoid ambiguity, the virgule must not be repeated on the same line unless parentheses are used. This is ensured when using named unit macros in \texttt{siunitx}, which will ‘trap’ repeated division and format it correctly. In complicated cases, negative exponents are to be preferred over other formats.
Products and errors should show what unit applies to each number given. Thus $(2 \times 3) \text{ m}$ is an ordered set of lengths of a geometric area, whereas $2 \times 3 \text{ m}$ is a length (and equal to $6 \text{ m}$). Thus, $\times$ is not a product but is a mathematical operator; in the same way, a $2 \times 3$ matrix is not a $6$ matrix! In some areas, areas and volumes are given with separated units but a unit raised to the appropriate power: $2 \times 3 \text{ m}^2$. Although this does display the correct overall units, it is potentially-confusing and is not encouraged.

Care must be taken when writing ranges of numbers. For purely numerical values, it is common to use an en-dash to show a range, for example ‘see pages 1–5′. On the other hand, physical quantities could be misinterpreted as negative values if written in this way. As the unit–number combination is a single mathematical entity, writing the values with an en-dash followed by a single unit is also incorrect. As a result, using the word ‘to’ is strongly recommended.

$1 \text{ m to } 5 \text{ m long.}$

$9.3 \text{ Graphs and tables}$

In graphs and tables, repetition of the units following each entry or axis mark is confusing and repetitive. It is therefore best to place the unit in the label part of the information. Placing the unit in square brackets is common but mathematically poor. Much better is to show division of all quantities by the unit, which leaves the entries as unitless ratios. This is illustrated in Table 52 and Figure 1.

\[
\begin{array}{cS}
\toprule
\text{Entry} & \text{Length/}\SI{}{\text{m}} \\
\midrule
1 & 1.1234 \\
2 & 1.1425 \\
3 & 1.7578 \\
4 & 1.9560 \\
\bottomrule
\end{array}
\]

\begin{table}
\centering
\caption{An example of table labelling.}

\caption{An example of graph labelling.}
\label{fig:xmpl:unitless}
\end{figure}

In most cases, adding exponent values in the body of a table is less desirable than adding a fixed exponent to column headers. An example is shown in Table 53. The use of \textbackslash\texttt{\textbackslash{}multicolumn} is needed here due to the ‘<’; without \textbackslash\texttt{\textbackslash{}multicolumn}, the titles are followed by ’kg’!

\begin{table}

10 Making suggestions and reporting bugs

Feedback on \texttt{siunitx} is always welcome, either to make suggestions or to report problems. When sending feedback, it is always useful if a small example file is included, showing the bug being reported or illustrating the desired output. It is helpful if a ‘reference rendering’ is included, showing what the output should look like. A typical example file might read

\begin{verbatim}
\listfiles
% Use the article class unless the problem is class-dependent
\documentclass{article}
\usepackage{siunitx}
% Other packages loaded as required
\begin{document}
Reference output: $1.23\,\text{m}$
\end{document}
\end{verbatim}

\texttt{siunitx} output: \texttt{\SI{1.23}{\text{metre}}}

As illustrated, it is usually best to use the \texttt{article} class and to only load packages which are needed to show the issue. It is also useful to include a copy of the log file generate by \TeX\ when reporting a bug (as the versions of packages can be important to solving the issue).

Feedback can be sent in a range of ways. The development code is hosted by GitHub, and the site includes an issue tracker. Adding feedback directly to the database means that other users can see it, and also ensures that it does not get forgotten. E-mailing directly will also definitely get attention: joseph.wright@morningstar2.co.uk.

11 Code level interfaces

At present, most interfaces in \texttt{siunitx} at the code level are internal. This largely reflects the parallel between \texttt{siunitx} and core \texttt{expl3} development: much of the code here was written whilst the \texttt{\LaTeX} team were defining how best to handle this area. Development work on the next major release of \texttt{siunitx} includes a full set of documented code level interfaces. Some of these will be added to this (release) version of the package over time, where this is appropriate.

\texttt{\textbackslash l\_siunitx\_unit\_symbolic\_seq}

This sequence contains all of the symbolic \texttt{(unit)} names defined: these will be in the form of control sequences such as \texttt{\textbackslash kilogram}. The order of the sequence is unimportant.

12 Thanks

Many users have provided feedback, bug reports and ideas for new features for \texttt{siunitx}: thanks to all of them. Particular thanks to Stefan Pinnow, who has taken the lead role as beta tester for \texttt{siunitx}, finding incorrect output, bad documentation and the odd spelling mistake in the documentation. Thanks also to Danie Els and Marcel Heldoorn.
for the \texttt{SIstyle} and \texttt{SIunits} packages, respectively, which provided the starting point for the development of \texttt{siunitx}.

Change History

v0.6
General: First public testing release (as \texttt{SI}) ............................ 1

v1.0
General: First official release .......................... 1

v1.1
General: Package extended to a greater range of unit types .............. 1

v1.2
General: Correct handling for ranges of numbers added .................. 1

v1.3
General: Better definition for micro symbol ............................. 1

v1.4
General: Detect entire document in non-serif font ........................ 1

v2.0
General: Complete re-write of package to add many new features ........ 1
Introduced \texttt{\numlist} and \texttt{\SIlist} functions ........................ 6

v2.0a
General: Detect use of version 1 options and automatically load appropriate configuration file 69
Fix various errors in version-1 configuration file ........................ 69
Include high energy physics units in
v2.00
General: Extend detect-italic option to other shapes, renaming as detect-shape as a result .......... 17
v2.0p
General: Actually get change from v2.00 working ............................ 1
v2.0q
General: Deal with bad definition of \color by textpos package ............ 1
Errors with free-standing unit code fixed ................................. 1
v2.0r
General: Error in definition for old decimalsymbol option corrected .. 69
v2.0s
General: Correct errors in rounding code when precision requested is zero decimal places .......... 1
Document how to do mixed bold and normal numbers in tables ...... 68
v2.0t
General: Replace \exp_afern in code for \per with \exp_after:W 1
v2.0u
General: Fix second possible issue with textpos package and \color ....... 1
Prevent infinite loop if \SI function is used with an empty number ... 1
v2.0v
General: Internal changes reflecting expl3 updates ......................... 1
v2.0w
General: Deal with internal function used by REV\TeX{} in tables ....... 1
v2.0x
General: Fix bug when detecting single prefixes and converting prefixes to numbers .................. 1
v2.0y
General: Error with tight-spacing option and exponents corrected ... 29
v2.1
General: New copy-complex-root option for moving input complex root to output .................. 27
New input-comparators option for numbers greater than, less than and so on ...................... 20
New power-font option for controlling whether superscript powers are treated as numbers or units .................. 40

v2.0b
General: Further improvements to version-1 configuration file .......... 69
v2.0c
General: Mixed literal and macro units now print more reliably ......... 1
v2.0d
General: Document special case situations for last cell in table row . 66
Fix error in table-format option concerning exponent signs ......... 1
v2.0e
General: Correct behaviour of \pm in numbers when abbreviations configuration is loaded: problem introduced in v2.0c .................... 1
v2.0f
General: Fix issue with spacing of multiplication sign in text mode .. 1
v2.0g
General: Fix issue with complex numbers in quotients ............... 1
Improve handling of complex root token ................................. 1
Introduce localisation for text values ................................. 1
Repair broken bracket-numbers option ................................. 1
v2.0h
General: Actually get localisation into the code ......................... 1
v2.0i
General: Correct behaviour of \of function so it actually works (bug introduced in v2.0d) ............. 11
v2.0j
General: Correct \hartree unit appearance ......................... 10
Ensure symbols specified in input-symbols are always printed in math mode .................. 1
v2.0k
General: Fix for babel French settings with \french in tabular material .... 1
v2.0l
General: Further adjustments to babel support ........................... 1
v2.0m
General: Re-introduce locale option .............................. 58
v2.0n
General: More abbreviated units ............................ 33

discussion of old configurations and in version-1 configuration file 69
Make \SendSettingsToPgf available in document body ............. 65
New round-minimum option to set a floor for rounding numbers downward .......................... 23
New scientific-notation option for to use exponent form for numbers in all cases ..................... 25
New table-align-exponent and table-align-uncertainty options for additional choices of table formatting .................................................. 49
New table-comparator option for reserving space for comparators in tables ............................... 47
New table-omit-exponent option for simplifying tables ......................................................... 51
New zero-integer-to-decimal option to convert integers to decimals on rounding ....................... 23

v2.1a
General: Ensure that output of list separators is in text mode ............... 1
Print prefixes correctly in text mode when converting to numerical value ............................. 1

v2.1b
General: Bug in hyphen printing when detecting mode sorted ............... 1
Bug in printing code for complex part with no number fixed ...................... 1

v2.1c
General: After reviewing internals, \numlist, \numrange, \SIlist and \SIrange are documented as requiring text mode due to issues with spacing and line breaks .... 1
Auto-detect math mode in tables and correct output accordingly .......... 1
Discourage line break between number and unit even when it is permitted ........................................ 1
New text choice for qualifier-mode option ......................................................... 40

v2.1d
General: Apply unit options when free-standing-units is active ........ 33
Error with definition of version 1 option xspace corrected .................. 69

v2.1e
General: Fix issues with text mode symbols and fontspec package .......... 1
Further corrections when applying unit options when free-standing-units is active ............. 33

v2.1f
General: Typo in definition for unit-optional-argument implementation corrected .......... 33

v2.1g
General: Checks on the versions of expl3 and xparse installed .......... 1

v2.1h
General: Detect AMS display-like environments ......................................... 1

v2.1i
General: Improved logic for per-mode setting symbol-or-fraction .......... 78
General: Allow for loading of inputenc package with no options ............. 1

v2.1k
General: Bug fix when printing superscript minus signs and using fontspec package ............ 1
New option detect-inline-family ............................................................. 18
Remove combined choice for option detect-inline-weight .................... 18

v2.1l
General: Error in font family detection introduced in v2.1k corrected .......... 18

v2.1m
General: Avoid expansion of erroneous literal units when these are forbidden ......................................................... 1
Ensure some output occurs in all cases when round-precision is set to 0 and round-mode is set to places ......................................................... 1

v2.1n
General: Consistent behaviour for round-integer-to-decimal when round-precision is 0 ........ 1
Set output to 0 when round-mode is figures and round-precision is 0 .......... 22

v2.1o
General: Account for negative exponents when using fixed-exponent system ........ 1
Fix incorrect font choice when arev package is loaded .......................... 1

v2.1p
General: Bad table alignment when some rows contain comparators fixed .... 1
Poor position of comparators in numbers fixed ........................................ 1
v2.2
General: Add new \tablenum macro to allow complex table alignments ... 1
Deprecate \DeclareSIUnitWithOptions ... 73
Extend \DeclareSIUnit to take optional argument .............. 12
Extend scientific-notation option to include engineering mode ..................... 25
Include leading 1 when per-mode is set to symbol and there are no numerator units in \si arguments . 38
New \highlight macro for selective colour in units ................. 11
New bracket-negative-numbers option .................. 29
New input-uncertainty-signs option .................. 21
New minimum-integer-digits option .................. 24
New output-exponent-marker option .................. 28
New table-align-comparator option for more control of table formatting .................. 49
New table-column-width option ........................ 56
Renamed angle-unit-separator option to angle-unit-product ... 73
Renamed inter-unit-separator option to inter-unit-product ... 73
Renamed number-unit-separator option to number-unit-product ... 73
Support use of \cancel macro in units .................. 11

v2.2a
General: Add missing default for group-digits option ........... 26
Expand macros with arguments correctly in tables .................. 1
Fix bug with literal units and auto-insertion of 1 when per-mode is symbol .................. 1
Fix issue with \* tokens in tabular preambles .................. 1
Group digits for input containing symbolic entries .................. 1
Insert tokens correctly when last tabular cell does not end \ .......................... 1

v2.2b
General: Fix bad formatting of negative exponents when using the output-exponent-marker option . 1
Fix bug with \highlight macro when no colour support is loaded . 1
Make \of work in hyper-linked sections .............................. 1

v2.2c
General: Fix bad interaction with cellspace package .................. 1

v2.2d
General: Fix the strict option ................................. 1

v2.2e
General: Fix incorrect interpretation of complex numbers with no real part 1

v2.2f
General: Fix setting table-column-width to 0 pt to restore auto-sizing .................. 56

v2.2g
General: Correctly space \degree and similar units in lists and ranges when only a single unit is given . 1
Ensure \tablenum works correctly when parse-numbers is set false . 15

v2.2h
General: Fix bug in significant figures rounding code for some integer part values .................. 1

v2.2i
General: Fix detect-mode option inside table cells .................. 1

v2.2j
General: Fix incorrect line breaking in \StrRange .......................... 1

v2.2k
General: Fix behaviour of subscripts inside alignments when printing in text mode .................. 1

v2.2l
General: Fix loss of main unit when per-mode is set to symbol and a pre-unit is used .................. 1

v2.3
General: Extend group-digits option, deprecating group-decimal-digits and group-integer-digits .......................... 26
Load abbreviations as standard ... 73
New group-minimum-digits option to replace group-four-digits ... 27
New \literal-superscript-as-power option for controlling how literal units superscripts behave .................. 40
New table-align-text-pre option 52
v2.3a
General: Restore fix in v2.2l missing in v2.3 ....................... 1
v2.3b
General: Adjust internal load order so that free-standing-units works correctly for abbreviations .............................. 1
More abbreviated units ........................................... 33
v2.3c
General: Fix display of ± in numbers when separate-uncertainty is true and literal units are used .......................... 1
v2.3d
General: Fix broken superscript display in literal unit mode ............. 1
v2.3e
General: Internal changes to work with \LaTeX3 updates ................... 1
v2.3f
General: Fix processing of numbers in tables when entire number is invalid ......................................................... 1
v2.3g
General: Deal with erroneous leading zero in some fixed exponent cases . 1
v2.3h
General: Ensure math mode for exponent products in all circumstances ............................................................... 1
Improvements to output when using \text4ht ............................... 1
v2.4
General: Automatically compress exponents for lists and ranges when fixed exponents are active ...................... 31
New exponent-to-prefix option ........................................ 43
New list-pair-separator option ........................................ 30
New round-half option .................................................. 23
Reduce number of math mode options, improving consistency of output ............................................................. 1
v2.4a
General: Extend search-and-replace code for UTF-8 characters .................. 1
Use a more cautious approach to changing settings at the start of the document .......................................................... 1
Use UTF-8 symbols with Xe\LaTeX{} and \LaTeX{} if fontspec is loaded . 58
v2.4b
General: Erroneous doubled # corrected .................................. 1
v2.4c
General: Erroneous check for text mode sanserif font fixed ................ 1
v2.4d
General: Fix for edge-case user commands in captions where the command clashes with a unit name ............... 1
v2.4e
General: Fix issue with inputenc package and some of the recent special symbol changes ................................. 1
v2.4f
General: Allow easier use of headings when not parsing numbers in tables .......................................................... 1
Fix bug with detection of bold font in table cells ....................... 1
v2.4g
General: Update internals to match changes in expl3 which caused issues with some tokens in numerical arguments .................. 1
v2.4h
General: Bug fix for implementation of reciprocal-positive-first ........ 1
v2.4i
General: Bug fix for rounding with large numbers of decimal places . 1
v2.4j
General: Leave vertical mode before any document-level commands .... 1
v2.4k
General: Internal changes to allow for breqn package tricks ................ 1
v2.4l
General: Fix a load-order issue with soulpos package ..................... 1
v2.4m
General: Correct bug in \SIlist when only a single number is given .... 1
v2.4n
General: Allow conversion of numbers with more than nine digits to scientific notation ........................................ 1
v2.5
General: Minor change to table code to give fewer underfull boxes when comparators are used .................. 1
New omit-uncertainty option ......................................... 25
New zero-decimal-to-integer option ................................. 23
Reduced number of intrinsically-mathematical options 1
Slight alteration of code order so that fixed-exponent can be used to remove an exponent part from numerical input ......................... 25
v2.5a
General: When creating free-standing unit, allow for ‘dynamic’ nature of spacing (bug introduced in v2.5) . . . 1
v2.5b
General: Deal correctly with ‘_’ and ‘_’ in literal units when breqn package is loaded ................................. 1
Detect eulervm package and alter math mode font setting accordingly ................................. 1
v2.5c
General: Allow conversion of numbers with more than nine digits when using fixed exponents ................... 1
Detect entirely empty cells in a columns ................................. 1
v2.5d
General: Extend range of settings automatically altered to use UTF-8 values is appropriate ................... 1
New phrase choice for qualifier-mode option ................... 40
New qualifier-phrase option ................... 40
v2.5e
General: Fix an internal error in unit expansion, introduced in v2.4f . . . 1
v2.5f
General: Track changes in expl3 ................................. 1
v2.5g
General: Fix binary-units option ................... 36
v2.5h
General: Alter literal unit test to allow spaces in units to be ignored ................................. 1
v2.5i
General: Fix alignment of values without uncertainties in columns where space is reserved for uncertainties ................................. 1
v2.5j
General: Fix rounding when uncertainties are present ................................. 1
v2.5k
General: Skip spaces correctly after start of document ................................. 1
Store fraction function as a macro rather than using \let: fixes a warning with amsmath ................... 1
v2.5l
General: Track changes in expl3 ................................. 1
v2.5m
General: Allow for right-to-left mode with bidi package ................................. 1
Fix bug with UTF8 engines and literal units ................................. 1
Handle \highlight correctly in bookmarks ................................. 1
Load binary-units only if requested ................................. 1
v2.5n
General: Fix transmission of grouping information by \SendSettingsToPgf ................................. 1
v2.5o
General: Update internals to track expl3 changes ................................. 1
v2.5p
General: Fix printing of \pm and \mp when used as signs in text mode ................................. 1
v2.5q
General: Reorder internals to allow for binary units in tables ................................. 1
Replace active ‘−’ in numbers with standard hyphen ................................. 1
v2.5r
General: Update internals to track expl3 changes ................................. 1
v2.5s
General: Update internals to track expl3 changes ................................. 1
v2.6
General: Allow for loading of mdwtab . . . 1
Fix printing exponent in tables when output-exponent-marker is active 28
Fix printing of uncertainties when the input is an integer and the uncertainty is given as a separate part ................................. 1
Fix spacing when printing comparators ................................. 1
Ignore hard spaces (‘’) in argument of \num ................................. 5
Preserve standard meaning of \fg in bookmarks when babel is loaded with the french option ................................. 1
Produce proper minus sign when tex4ht is in use ................................. 1
Switch standard setting for mode option to aath ................... 19

86
v2.6a
  General: Better glyph selection when fontspec is detected 1
  
v2.6b
  General: Extend range of font shapes which can be detected 1
  
v2.6c
  General: Fix use of \textmu{} when fontspec is loaded but unicode-math is not 1
  
v2.6d
  General: Fix conversion of ‘long’ to ‘short’ uncertainty values with integer mantissas 1
  
v2.6e
  General: Auto-detect some packages where fontspec should not affect default symbol use 1
  
v2.6f
  General: Fix table-sign-exponent and table-sign-mantissa options when set false 1
  Further work on mathspec 1
  
v2.6g
  General: Fix issue with empty table cells 1
  
v2.6h
  General: Update internals to track expl3 changes 1
  
v2.6i
  General: Fix behaviour of \textcancel{} when printing in math mode 1
  Fix rounding of numbers with large numbers of digits 1
  
v2.6j
  General: Print ± correctly when exponent-to-prefix is set 1
  Print all units when exponent-to-prefix is set 1
  
v2.6k
  General: Track expl3 changes 1
  
v2.6l
  General: Fix an internal error 1
  
v2.6m
  General: Address an issue with mwtab 1
  
v2.6n
  General: Fix angstrom symbol with LuaTgX 1
  Improve definition for degree Celsius 1
  
v2.6o
  General: Allow for unit powers when converting exponents to prefixes 1
  
v2.6p
  General: Allow for reciprocal powers when converting exponents to prefixes 1
  Improve definition for degree Celsius 1
  
v2.6q
  General: Correctly select font when document commands are used inside table cells in 8 columns 1
  
v2.6r
  General: Address color safety issue 1
  Correctly handle e0 1
  Minor expl3 fixes 1
  Warn when color support is not available 1
  
v2.6s
  General: Drop one excess warning 1
  
v2.6t
  General: Fix issues when units are not parsed 1
  
v2.6u
  General: Fix an issue with large numbers and scientific mode 1
  
v2.6v
  General: Fix spacing of integers in tables when aligning decimal marker to center 1
  
v2.6w
  General: Avoid doubled pre-number tokens in tables 1
  
v2.6x
  General: Allow + to indicate a sign 47
  
v2.6y
  General: Fix spacing with reciprocal-positive-first setting 38
  
v2.6z
  General: Avoid an issue with recent expl3 update 1
  
v2.7a
  General: Internal changes 1
  
v2.7b
  General: Rename an incorrect variable 1
  
v2.7c
  General: Fix issues when units are not parsed 1
  
v2.7d
  General: Track unicode-math changes 1
  
v2.7e
  General: Update \texttt{astronomicalunit} unit 10
v2.7n
General: Fix issue with symbolic input and digit grouping
Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.
